1	TPH_REQ_CAP_INT_VEC	* Varies	Interrupt Vector Mode Supported in the shadow register. If set indicates that the Function supports the Interrupt Vector Mode of operation. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: No access ■ Dbi: No access ■ Dbi2: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: TPH_IVEC_0 Exists: (CX_TPH_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
0	TPH_REQ_NO_ST_MODE	R	No ST Mode Supported in the shadow register. set indicates that the Function supports the No ST Mode of operation. This mode is required to be supported by all Functions that implement this Capability structure. This bit must have a value of 1b. Value After Reset: 0x1 Exists: (CX_TPH_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

3.23 PF_ATS_CAPi Registers

3.23.1 ATS_CAP_HDR_REG

- **Name:** ATS Extended Capability Header.
- **Description:** This register provides value of Capability ID, Capability version, and next offset of Extended capability structure.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. The offset to the next PCI Extended Capability structure or 000h if no other items exist in the linked list of capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. 3.23.2 ATS_CAPABILITIES_CTRL_REG

- **Name:** ATS Requester Capability Register.
- **Description:** This register provides value of Invalidate queue depth, Page alignment request, and Global Invalidate support. It also controls Cache translation and Smallest Translate Unit.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Table 3-152 Fields for Register: ATS_CAPABILITIES_CTRL_REG

Bits	Name	Memory Access	Description
31	ENABLE	R/W	Enable (E). When Set, the Function is enabled to cache translations. Behavior is undefined if this bit is Set, and the value of the PASID Enable, Execute Requested Permission Enable, or Privileged Mode Requested Enable bits are changed. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: {(CX_EXTENSIBLE_VFUNC) ? "untestable" : "unconstrained" }

Bits	Name	Memory Access	Description
30:21	RSVDP_21	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
20:16	STU	R/W	Smallest Translation Unit (STU). This value indicates to the Function the minimum number of 4096-byte blocks that is indicated in a Translation Completions or Invalidate Requests. This is a power of 2 multiplier and the number of blocks is 2 STU. A value of 0 0000b indicates one block and a value of 1 1111b indicates 2 ³¹ blocks (or 8 TB total). Value After Reset: ATS_STU_0 Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
15:7	RSVDP_7	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
6	GLOBAL_INVALID_SPPRTD	* Varies	Global Invalidate Supported. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) and more specifically: (CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN && CX_PASID_ENABLE) ? R/W : (CX_MEMORY_MAP_VIEW==0) ? R: (CX_MEMORY_MAP_VIEW==1) ? R: R <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SET): The Function supports Invalidation Requests that have the Global Invalidate bit Set. ■ 0x0 (CLEAR): The Function ignores the Global Invalidate bit in all Invalidate Requests. This bit is 0b if the Function does not support the PASID TLP Prefix. Value After Reset: DEFAULT_ATS_GLOBAL_INVALID_SPPRTD Exists: (CX_ATS_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
5	PAGE_ALIGNED_REQ	* Varies	Page Aligned Request. If Set, indicates the Untranslated Address is always aligned to a 4096 byte boundary. Setting this field is recommended. This field permits software to distinguish between implementations compatible with this specification and those compatible with an earlier version of this specification in which a Requester was permitted to supply anything in bits [11:2]. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Table 3-154 Fields for Register: ACS_CAPABILITIES_CTRL_REG

Bits	Name	Memory Access	Description
31:23	RSVDP_23	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1))

Bits	Name	Memory Access	Description
22	ACS_DIRECT_TRANSLATED_P2P_EN	R/W	ACS Direct Translated Peer-to-Peer Enable. When Set, overrides the ACS_P2P_REQ_REDIRECT and ACS_P2P_EGRESS_CONTROL mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address. This bit is ignored if ACS_AT_BLOCK_EN is 1b. The controller hardwires this bit to 0b if, the ACS Direct Translated P2P functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true
21	ACS_P2P_EGRESS_CONTROL_EN	R/W	ACS Peer-to-Peer Egress Control Enable. In conjunction with the Egress Control Vector plus the ACS_P2P_REQ_REDIRECT and ACS_DIRECT_TRANSLATED_P2P mechanisms, determines when to allow, disallow, or redirect peer-to-peer Requests. The controller hardwires this bit to 0b if, the ACS P2P Egress Control functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true
20	ACS_USP_FORWARDING_EN	R/W	ACS Upstream Forwarding Enable. When Set, the component forwards Upstream any Request or Completion TLPs it receives that were redirected Upstream by a component lower in the hierarchy. This bit only applies to Upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. The controller hardwires this bit to 0b if, the ACS Upstream Forwarding functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
19	ACS_P2P_CPL_REDIRECT_EN	R/W	ACS Peer-to-Peer Completion Redirect Enable. Determines when the component redirects peer-to-peer Completions Upstream; applicable only to Completions whose Relaxed Ordering Attribute is clear. The controller hardwires this bit to 0b if, the ACS P2P Completion Redirect functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true
18	ACS_P2P_REQ_REDIRECT_EN	R/W	ACS Peer-to-Peer Request Redirect Enable. In conjunction with ACS_P2P_EGRESS_CONTROL and ACS_DIRECT_TRANSLATED_P2P mechanisms, determines when the component redirects peer-to-peer Requests Upstream. With Downstream Ports, this bit only applies to Upstream Requests arriving at the Downstream Port, and whose normal routing targets a different Downstream Port. The controller hardwires this bit to 0b if, the ACS P2P Request Redirect functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true
17	ACS_AT_BLOCK_EN	R/W	ACS Translation Blocking Enable. When Set, the component blocks all Upstream Memory Requests whose Address Translation (AT) field is not set to the default value. The controller hardwires this bit to 0b if, the ACS Translation Blocking functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
16	ACS_SRC_VALID_EN	R/W	ACS Source Validation Enable. When Set, the component validates the Bus Number from the Requester ID of Upstream Requests against the secondary/subordinate Bus Numbers. The controller hardwires this bit to 0b if, the ACS Source Validation functionality is not implemented. Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Testable: writeAsRead Volatile: true
15:8	ACS_EGRESS_CTRL_SIZE	* Varies	ACS Egress control vector size. Encodings 01h-FFh directly indicate the number of applicable bits in the Egress Control Vector; the encoding 00h indicates 256 bits. If the ACS_P2P_EGRESS_CONTROL bit is 0b, the value of the size field is undefined, and the Egress Control Vector register is not required to be present. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: CX_ACS_EGRESS_CTRL_SIZE_0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1)) Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\" "
7	RSVDP_7	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_ACS_ENABLE && (((CX_NFUNC==1 CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) CX_MEMORY_MAP_PCIE_TYPE!=1))

Bits	Name	Memory Access	Description
6	ACS_DIRECT_TRANSLATED_P2P	* Varies	ACS Direct Translated Peer-to-Peer Capable. Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for Multi-Function Device Functions that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Functions; the controller must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Direct Translated P2P. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. 3.24.3 ACS_EGRESS_CTRL_VECTOR_REGi (for i = 0; i <= 7)

- **Name:** Access Control Services Egress Control Vector Register #i
- **Description:** This Egress Control Vector register is a read-write register that contains a bit-array. The number of bits in the register is specified by the ACS_EGRESS_CTRL_SIZE field, and the register spans multiple DWORDs, if required.
- **Size:** 32 bits
- **Offset:** B+0x8 + i*0x4
- **Exists:** (CX_ACS_ENABLE && (((CX_NFUNC==1 | | CX_SRIOV_ENABLE==0) && CX_MEMORY_MAP_PCIE_TYPE==1) | | CX_MEMORY_MAP_PCIE_TYPE!=1))

15:0	PRS_CAP_ID	* Varies	Page Request Services PCI Express Extended Capability ID. This field indicates that the associated extended capability structure is a Page Request Extended Capability. This field must return a Capability ID of 0013h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffff (MAX_VAL): Max value Value After Reset: 0x13 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.25.2 PRS_CONTROL_STATUS_REG

- **Name:** Page Request Services Control and Status Register.
- **Description:** This register provides control and status of different capability such as Reset, Response Failure, ans so on.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 | | CX_MEMORY_MAP_PCIE_TYPE==2))

PRS_PASID	31
RSVDP_25	30:25
PRS_STOPPED	24
RSVDP_18	23:18
PRS_UPRGI	17
PRS_RESP_FAILURE	16
RSVDP_2	15:2
PRS_RESET	1
PRS_ENABLE	0

Table 3-157 Fields for Register: PRS_CONTROL_STATUS_REG

Bits	Name	Memory Access	Description
31	PRS_PASID	* Varies	The PASID TLP Prefix is required. Function behavior is undefined if this bit is Clear and the Function receives a PRG Response Message with a PASID TLP Prefix. Function behavior is undefined if this bit is Set and the Function receives a PRG Response Message with no PASID TLP Prefix when the corresponding Page Requests had a PASID TLP Prefix. This bit is RsvdZ if the Function does not support the PASID TLP Prefix . <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): The Function does not expect PASID TLP Prefixes on any PRG Response Message. ■ 0x1 (SET): The Function expects a PASID TLP Prefix on PRG Response Messages when the corresponding Page Requests had a PASID TLP Prefix. Value After Reset: CX_PRG_PASID_REQUIRED Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
30:25	RSVDP_25	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
24	PRS_STOPPED	R	PRS mechanism stopped requests for additional pages. This field is only meaningful if Enable is Clear. If Enable is Set, this field is undefined. When the Enable field is Cleared, after having been previously Set, the interface transitions to the stopping state and Clears this field. After all page requests currently outstanding at the Function(s) have completed, this field is Set and the interface enters the disabled state. If there were no outstanding page requests, this field may be Set immediately when Enable is Cleared. Resetting the interface will cause an immediate transition to the disabled state. While in the stopping state, receipt of a Response Failure message will result in the immediate transition to the disabled state (Setting this field). For SR-IOV, this field is Set only when all associated Functions (PF and VFs) have stopped issuing page requests. The cfg_prs_stopped output pin reflects the value of this register field. Values: ■ 0x0 (CLEAR): The associated page request interface either has not stopped or has stopped issuing new Page Requests but has outstanding Page Requests. ■ 0x1 (SET): The associated page request interface has stopped issuing additional page requests and that all previously issued Page Requests have completed. Value After Reset: 0x1 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
23:18	RSVDP_18	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
17	PRS_UPRGI	R/W1C	PRS has received a response with Unexpected Page Request Group Index. This field, when Set, indicates that the Function has received a PRG Response Message containing a PRG index that has no matching request. This field is Set by the Function and cleared when a one is written to the field. For SR-IOV, this field is Set in the PF if any associated Function (PF or VF) receives a PRG Response Message that does has no matching request. The <code>cfg_prs_uprgi</code> output pin reflects the value of this register field. Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
16	PRS_RESP_FAILURE	R/W1C	PRS has received a PRG response failure. This field, when Set, indicates that the Function has received a PRG Response Message indicating a Response Failure. The Function expects no further responses from the host (any received are ignored). This field is Set by the Function and Cleared when a one is written to the field. For SR-IOV, this field is Set in the PF if any associated Function (PF or VF) receives a PRG Response Message indicating Response Failure. The <code>cfg_prs_response_failure</code> output pin reflects the value of this register field. Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
15:2	RSVDP_2	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
1	PRS_RESET	R	Page Request Services Reset. Reads of this field return 0b. The <code>cfg_prs_reset</code> output pin reflects the value of this register field. Values: ■ 0x0 (CLEAR): No action is initiated if this field is written to 0b, or if this field is written with any value while the Enable field is set. ■ 0x1 (SET): When the Enable field is clear, or is being cleared in the same register update that sets this field, writing a 1b to this field, clears the associated implementation dependent page request credit counter and pending request state for the associated Page Request Interface. Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
0	PRS_ENABLE	R/W	Page Request Services Enabled. If both this field and the Stopped field are Clear, then the Page Request Interface will not issue new page requests, but has outstanding page requests that have been transmitted or are queued for transmission. When the Page Request Interface is transitioned from not-Enabled to Enabled, its status flags (Stopped, Response Failure, and Unexpected Response flags) are cleared. Enabling a Page Request Interface that has not successfully Stopped has indeterminate results. The <code>cfg_prs_enable</code> output pin reflects the value of this register field. Values: ■ 0x0 (CLEAR): The Page Request Interface is not allowed to issue page requests. ■ 0x1 (SET): Indicates that the Page Request Interface is allowed to make page requests. Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

3.25.3 PRS_REQ_CAPACITY_REG

- **Name:** Page Request Services Outstanding Capacity.
- **Description:** This register contains the number of outstanding page request messages the associated Page Request Interface physically supports.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 | | CX_MEMORY_MAP_PCIE_TYPE==2))

Table 3-158 Fields for Register: PRS_REQ_CAPACITY_REG

Bits	Name	Memory Access	Description
31:0	PRS_OUTSTANDING_CAPACITY	* Varies	Page Request Services Outstanding Capacity value. This is the upper limit on the number of pages that can be usefully allocated to the Page Request Interface. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffffffff (MAX_VAL): Max value Value After Reset: CX_PRS_OUTSTANDING_CAPACITY_VALUE_0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.25.4 PRS_REQ_ALLOCATION_REG

- **Name:** Page Request Services Outstanding Allocation.
- **Description:** This register contains the number of outstanding page request messages the associated Page Request Interface is allowed to issue (have outstanding at any given instance).
- **Size:** 32 bits
- **Offset:** B+0xc
- **Exists:** (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

Table 3-159 Fields for Register: PRS_REQ_ALLOCATION_REG

Bits	Name	Memory Access	Description
31:0	PRS_OUTSTANDING_ALLOCATION	R/W	Page Request Services Outstanding Allocation value. This Field contains the number of outstanding page request messages the associated Page Request Interface is allowed to issue. The cfg_prs_outstanding_allocation output pin reflects the value of this register field. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Exists: (CX_PRS_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

3.26 PF0_LTR_CAP Registers

3.26.1 LTR_CAP_HDR_REG

- **Name:** LTR Extended Capability Header.
- **Description:** This register provides capability ID, capability version and next offset value for LTR(Latency Tolerance Reporting).
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

NEXT_OFFSET	CAP_VERSION	CAP_ID

Table 3-160 Fields for Register: LTR_CAP_HDR_REG

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on version of the specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
15:0	CAP_ID	* Varies	LTR Extended Capacity ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability for the LTR Extended Capability is 0018h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x18 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.26.2 LTR_LATENCY_REG

- **Name:** LTR Max Snoop and No-Snoop Latency Register.
- **Description:** This register indicates Latency scale and vlaue for Max Snoop and No-Snoop.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

31:29	RSVDP_29
28:26	MAX_NO_SNOOP_LAT_SCALE

12:10	MAX_SNOOP_LAT_SCALE
9:0	MAX_SNOOP_LAT

Table 3-161 Fields for Register: LTR_LATENCY_REG

Bits	Name	Memory Access	Description
31:29	RSVDP_29	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
28:26	MAX_NO_SNOOP_LAT_SCALE	R/W	Max No-Snoop Latency Scale. This register provides a scale for the value contained within the Max No-Snoop LatencyValue field. Encoding is the same as the LatencyScale fields in the LTR Message. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Hardware operation is undefined if software writes a Not Permitted value to this field. Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
25:16	MAX_NO_SNOOP_LAT	R/W	Max No-Snoop Latency Value. Along with the Max No-Snoop LatencyScale field, this register specifies the maximum no-snoop latency that a device is permitted to request. Software should set this to the platform's maximum supported latency or less. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
15:13	RSVDP_13	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
12:10	MAX_SNOOP_LAT_SCALE	R/W	Max Snoop Latency Scale. This register provides a scale for the value contained within the Max Snoop LatencyValue field. Encoding is the same as the LatencyScale fields in the LTR Message. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Hardware operation is undefined if software writes a Not Permitted value to this field. Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
9:0	MAX_SNOOP_LAT	R/W	Max Snoop Latency Value. Along with the Max Snoop LatencyScale field, this register specifies the maximum snoop latency that a device is permitted to request. Software should set this to the platform's maximum supported latency or less. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Value After Reset: 0x0 Exists: (CX_LTR_M_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

3.27 PF0_L1SUB_CAP Registers

3.27.1 L1SUB_CAP_HEADER_REG

- **Name:** L1 Substates Extended Capability Header.
- **Description:** L1 Substates Extended Capability Header provides capability ID, capability version and next offset value for L1 Substates.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2))

NEXT_OFFSET	CAP_VERSION	EXTENDED_CAP_ID

Table 3-162 Fields for Register: L1SUB_CAP_HEADER_REG

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h, if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on version of the specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
15:0	EXTENDED_CAP_ID	* Varies	L1SUB Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for L1 PM Substates is 001Eh. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. 31:24	RSVDP_24	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2))

Bits	Name	Memory Access	Description
23:19	PWR_ON_VALUE_SUPPORT	* Varies	Port T Power On Value. Along with the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register sets the time (in us) that this Port requires the port on the opposite side of Link to wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT L1SUB_CAPABILITY_REG.L1_2_PCI_PM_SUPPORT ? Bits	Name	Memory Access	Description
17:16	PWR_ON_SCALE_SUPPORT	* Varies	Port T Power On Scale. Specifies the scale used for the Port T_POWER_ON_VALUE field in the L1 PM Substates Capabilities register. Range of values are given below. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT L1SUB_CAPABILITY_REG.L1_2_PCI_PM_SUPPORT ? RWS : RSVDP Values: ■ 0x0 (_2us): Scale is 2us ■ 0x1 (_10us): Scale is 10us ■ 0x2 (_100us): Scale is 100us ■ 0x3 (Reserved): Reserved Value After Reset: DEFAULT_L1SUB_PORT_T_POWER_ON_SCALE Exists: (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
15:8	COMM_MODE_SUPPORT	* Varies	Port Common Mode Restore Time. Time (in us) required for this Port to re-establish common mode. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT L1SUB_CAPABILITY_REG.L1_2_PCI_PM_SUPPORT ? Table 3-164 Fields for Register: L1SUB_CONTROL1_REG

Bits	Name	Memory Access	Description
31:29	L1_2_TH_SCA	* Varies	LTR L12 Threshold Scale. This field provides a scale for the value contained within the LTR_L1.2_THRESHOLD_Value. Hardware operation is undefined if software writes a Not-Permitted value to this field. Required for all Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP ■ Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Value After Reset: 0x0 Exists: (CX_L1_SUBSTATES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead

Bits	Name	Memory Access	Description
25:16	L1_2_TH_VAL	* Varies	LTR L12 Threshold Value. Along with the LTR_L1.2_THRESHOLD_Scale, this field indicates the LTR threshold used to determine if entry into L1 results in L1.1 (if enabled) or L1.2 (if enabled). Required for all Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? 7:3	T_POWER_ON_VALUE	* Varies	T Power On Value. Along with the T_POWER_ON_SCALE sets the minimum amount of time (in us) that the Port must wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. T_POWER_ON is calculated by multiplying the value in this field by the value in the T_POWER_ON_SCALE field. Required for all Ports that support L1.2, otherwise this field is of type RsvdP. This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. 23:12	DL_UP_TIME	* Varies	DL_UP Time. DL_UP Time is the time the Function requires to become Configuration-Ready after the Downstream Port above the Function reports Data Link Layer Link Active. This field is RsvdP in Functions that are not associated with an Upstream Port. This field is undefined when the Valid bit is Clear. This field must be less than or equal to the encoded value A1Eh. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: CX_RN_RTR_DL_UP_VALUE_0 Exists: (CX_RN_RTR_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead
11:0	RESET_TIME	* Varies	Reset Time. Reset Time is the time the Function requires to become Configuration-Ready after the completion of Conventional Reset. This field is RsvdP if the Immediate Readiness bit is Set. This field is undefined when the Valid bit is Clear. This field must be less than or equal to the encoded value A1Eh. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: CX_RN_RTR_RESET_VALUE_0 Exists: (CX_RN_RTR_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

31:29	RSVDP_29	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
28:24	LNR_REGISTRATION_LIMIT	R/W	LNR Registration Limit. This field, encoded as a power of 2, imposes a limit on the number of cachelines that this LN Requester is permitted to register concurrently. For example, a value of 00100b indicates that the LN Requester must not register more than 16 cachelines (2^4) concurrently. Value After Reset: 0x1f Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
23:18	RSVDP_18	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
17	LNR_CLS	R/W	LNR CLS. This bit controls or indicates the cacheline size used with LN protocol by this Requester. If this LN Requester supports only one cacheline size, this bit is permitted to be hardwired to indicate that size. Otherwise, the default value of this bit is 0b. Values: 0x1 (SET): The Cacheline size is 128 bytes. 0x0 (CLEAR): The cacheline size is 64 bytes. Value After Reset: 0x0 Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
16	LNR_ENABLE	R/W	LNR Enable. When this bit is Set, the Endpoint is enabled to operate as an LN Requester. Software is permitted to Clear this bit at any time. Value After Reset: 0x0 Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
15:13	RSVDP_13	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_LN_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
12:8	LNR_REGISTRATION_MAX	* Varies	LNR Registration Max. This field, encoded as a power of 2, indicates the maximum number of cachelines that this LN Requester is capable of registering concurrently. For example, a value of 00101b indicates that the LN Requester might be capable of registering up to 32 cachelines (2^5) concurrently, and is capable of registering greater than 16. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
15:0	EXTENDED_CAP_ID	* Varies	PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for the Vendor-Specific Extended Capability is 000Bh. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffff (MAX_VAL): Max value Value After Reset: 0xb Exists: (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

3.33.2 VENDOR_SPECIFIC_HEADER_REG

- **Name:** Vendor-Specific Header.
- **Description:** This Register field provides VSEC Length, VSEC ID and VSEC Rev (Version Number). Vendor-specific software must qualify the associated Vendor ID of the PCI Express Function or RCRB before attempting to interpret the values in the VSEC ID or VSEC Rev fields.
- **Size:** 32 bits

31:20	VSEC_LENGTH	R	VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xfff (MAX_VAL): Max value Value After Reset: 0x100 Exists: (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
19:16	VSEC_REV	R	VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xf (MAX_VAL): Max value Value After Reset: 0x4 Exists: (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
15:0	VSEC_ID	R	VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffff (MAX_VAL): Max value Value After Reset: 0x2 Exists: (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.33.3 EVENT_COUNTER_CONTROL_REG

- **Name:** Event Counter Control.
- **Description:** This is a viewport control register.
 - Setting the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register determine the Event Counter data returned by the EVENT_COUNTER_DATA_REG viewport register.
 - Setting the EVENT_COUNTER_ENABLE field in this register enables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register.
 - Setting the EVENT_COUNTER_CLEAR field in this register clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register.
 - Reading the EVENT_COUNTER_STATUS field in this register returns the Enable status of the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
4:2	EVENT_COUNTER_ENABLE	W	Event Counter Enable. Enables/disables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. By default, all event counters are disabled. You can enable/disable a specific Event Counter by writing the 'per event off' or 'per event on' codes. You can enable/disable all event counters by writing the 'all on' or 'all off' codes. The read value is always '0'. For other values no change. Values: ■ 0x1 (PER_EVENT_OFF): per event off ■ 0x3 (PER_EVENT_ON): per event on ■ 0x5 (ALL_OFF): all off ■ 0x7 (ALL_ON): all on Value After Reset: 0x0 Exists: CX_RAS_DES_EC_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
1:0	EVENT_COUNTER_CLEAR	W	Event Counter Clear. Clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. You can clear the value of a specific Event Counter by writing the 'per clear' code and you can clear all event counters at once by writing the 'all clear' code. The read value is always '0'. Other values are reserved. Values: ■ 0x0 (NO_CHANGE): no change ■ 0x1 (PER_CLEAR): per clear ■ 0x2 (NO_CHANGE_2): no change ■ 0x3 (ALL_CLEAR): all clear Value After Reset: 0x0 Exists: CX_RAS_DES_EC_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

3.33.4 EVENT_COUNTER_DATA_REG

- **Name:** Event Counter Data.

Table 3-191 Fields for Register: TIME_BASED_ANALYSIS_CONTROL_REG

Bits	Name	Memory Access	Description
31:24	TIME_BASED_REPORT_SELECT	R/W	Time-based Report Select. Selects what type of data is measured for the selected duration (TIME_BASED_DURATION_SELECT), and returned in TIME_BASED_ANALYSIS_DATA. Each type of data is measured using one of three types of units: ■ Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x00] * TIME_BASED_ANALYSIS_DATA. Values 0-4 and 7-8 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. ■ Aux_clk Cycles. Total time in ps is [Period of platform specific clock] * TIME_BASED_ANALYSIS_DATA. Values 5, 6, and 9 correspond to aux_clk Cycles. ■ Core_clk Cycles for 20GT/s, 25GT/s (CCIX ESM data rate). Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x10] * TIME_BASED_ANALYSIS_DATA. Values 10-14 and 17-18 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. ■ Data Bytes. Actual amount of bytes is 16 * TIME_BASED_ANALYSIS_DATA. Values 20-23 correspond to data bytes. All encodings other than the defined encodings are reserved. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (ONE_CYCLE): Duration of 1 cycle ■ 0x1 (TX_L0S): TxL0s ■ 0x2 (RX_L0S): RxL0s ■ 0x3 (L0): L0 ■ 0x4 (L1): L1 ■ 0x7 (CFG_RCVRY): Configuration/Recovery ■ 0x8 (TX_RX_L0S): TxL0s and RxL0s

3.33.8 EINJ_ENABLE_REG

- **Name:** Error Injection Enable.
- **Description:** Each type of error insertion is enabled by the corresponding bit in this register. The specific injection controls for each type of error are defined in the following registers:
 - 0: CRC Error: EINJ0_CRC_REG
 - 1: Sequence Number Error: EINJ1_SEQNUM_REG
 - 2: DLLP Error: EINJ2_DLLP_REG
 - 3: Symbol DataK Mask Error or Sync Header Error: EINJ3_SYMBOL_REG
 - 4: FC Credit Update Error: EINJ4_FC_REG
 - 5: TLP Duplicate/Nullify Error: EINJ5_SP_TLP_REG
 - 6: Specific TLP Error: EINJ6_COMPARE_*_REG/EINJ6_CHANGE_*_REG/EINJ6_TLP_REG

After the errors have been inserted by controller, it will clear each bit here. For more information, see the RAS DES section in the Controller Operations chapter of the *Databook*.

3.33.9 EINJ0_CRC_REG

- **Name:** Error Injection Control 0 (CRC Error).
- **Description:** Controls the insertion of errors into the CRC, and parity of ordered sets for the selected type of the packets as follows:
 - **LCRC.** Bad TLP will be detected at the receiver side; receiver responds with NAK DLLP; Data Link Retry starts.
 - **16-bit CRC of ACK/NAK DLLPs.** Bad DLLP occurs at the receiver side; Replay NUM Rollover occurs.
 - **16-bit CRC of UpdateFC DLLPs.** Error insertion continues for the specific time; LTSSM transitions to the Recovery state because of the UpdateFC timeout (if the timeout is implemented at the receiver of the UpdateFCs).
 - **ECRC.** If ECRC check is enabled, ECRC error is detected at the receiver side.
 - **FCRC.** Framing error will be detected, TLP is discarded, and the LTSSM transitions to Recovery state.
 - **Parity of TSOS.** Error insertion continues for the specific time; LTSSM Recovery/Configuration timeout will occur.
 - **Parity of SKPOS.** Lane error will be detected at the receiver side.
- **Size:** 32 bits
- **Offset:** B+0x34
- **Exists:** (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

3.33.10 EINJ1_SEQNUM_REG

- **Name:** Error Injection Control 1 (Sequence Number Error).
- **Description:** Controls the sequence number of the specific TLPs and ACK/NAK DLLPs. Data Link Protocol Error will be detected at the Rx side of ACK/NAK DLLPs when one of these conditions is true:
 - $((\text{NEXT_TRANSMIT_SEQ} - 1) - \text{AckNak_Seq_Num}) \bmod 4096 > 2048$
 - $(\text{AckNak_Seq_Num} - \text{ACKD_SEQ}) \bmod 4096 \geq 2048$

TLP is treated as Duplicate TLP at the Rx side when all these conditions are true:

 - $\text{Sequence Number} \neq \text{NEXT_RCV_SEQ}$
 - $(\text{NEXT_RCV_SEQ} - \text{Sequence Number}) \bmod 4096 \leq 2048$

TLP is treated as Bad TLP at the Rx side when all these conditions are true:

 - $\text{Sequence Number} \neq \text{NEXT_RCV_SEQ}$ and
 - $(\text{NEXT_RCV_SEQ} - \text{Sequence Number}) \bmod 4096 > 2048$
- **Size:** 32 bits
- **Offset:** B+0x38
- **Exists:** $(\text{CX_RAS_DES_ENABLE} \&\& (\text{CX_MEMORY_MAP_PCIE_TYPE} == 2 \mid \mid \text{CX_MEMORY_MAP_PCIE_TYPE} == 0))$

Bits	Name	Memory Access	Description
28:16	EINJ1_BAD_SEQNUM	R/W	Bad sequence number. Indicates the value to add/subtract from the naturally-assigned sequence numbers. This value is represented by two's complement. For example: ■ Set Type, SEQ# and Count □ EINJ1_SEQNUM_TYPE =0 (Insert errors into new TLPs) □ EINJ1_BAD_SEQNUM =0x1FFD (represents -3) □ EINJ1_COUNT =1 ■ Enable Error Injection □ ERROR_INJECTION1_ENABLE =1 ■ Send a TLP from the controller's Application Interface □ Assume SEQ#5 is given to the TLP. ■ The SEQ# is Changed to #2 by the Error Injection Function in Layer2. □ $5 + (-3) = 2$ ■ The TLP with SEQ#2 is Transmitted to PCIe Link. <i>Note:</i> This register field is sticky. Values: ■ 0xfff (MAX_VAL): +4095 ■ 0x1001 (MIN_VAL): -4095 Value After Reset: 0x0 Exists: CX_RAS_DES_EINJ_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
8	EINJ1_SEQNUM_TYPE	R/W	Sequence number type. Selects the type of sequence number. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (TLP_ERR): Insertion of New TLP's SEQ# error ■ 0x1 (ACK_NAK_DLLP_ERR): Insertion of ACK/NAK DLLP's SEQ# Error Value After Reset: 0x0 Exists: CX_RAS_DES_EINJ_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
7:0	EINJ1_COUNT	R/W	Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION1_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION1_ENABLE=1, the errors are inserted until ERROR_INJECTION1_ENABLE is set to '0'. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_EINJ_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

3.33.11 EINJ2_DLLP_REG

- **Name:** Error Injection Control 2 (DLLP Error).
- **Description:** Controls the transmission of DLLPs and inserts the following errors:
 - If "ACK/NAK DLLP's transmission block" is selected, replay timeout error will occur at the transmitter of the TLPs and then Data Link Retry will occur.
 - If "Update FC DLLP's transmission block" is selected, LTSSM will transition to the Recovery state because of the UpdateFC timeout (if the timeout is implemented at the receiver of the UpdateFCs).
 - If "Always Transmission for NAK DLLP" is selected, Data Link Retry will occur at the transmitter of the TLPs. Furthermore, Replay NUM Rollover will occur when the transmitter has been requested four times to send the TLP with the same sequence number.
- **Size:** 32 bits
- **Offset:** B+0x3c
- **Exists:** (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

3.33.12 EINJ3_SYMBOL_REG

- **Name:** Error Injection Control 3 (Symbol Error).
- **Description:** When 8b/10b encoding is used, this register controls error insertion into the special (K code) symbols.
 - If TS1/TS2/FTS/E-Idle/SKP is selected, it affects whole of the ordered set. It might cause timeout of the LTSSM.
 - If END/EDB/STP/SDP is selected, TLP/DLLP will be discarded at the receiver side.When 128b/130b encoding is used, this register controls error insertion into the sync-header.

3.33.13 EINJ4_FC_REG

- **Name:** Error Injection Control 4 (FC Credit Error).
- **Description:** Controls error insertion into the credit value in the UpdateFCs. It is possible to insert errors for any of the following types:

- Posted TLP Header credit
- Non-Posted TLP Header credit
- Completion TLP Header credit
- Posted TLP Data credit
- Non-Posted TLP Data credit
- Completion TLP Data credit

These errors are not correctable while error insertion is enabled. Receiver buffer overflow error might occur.

3.33.14 EINJ5_SP_TLP_REG

- **Name:** Error Injection Control 5 (Specific TLP Error).
- **Description:** Controls the generation of specified TLPs. Correctable errors will occur which will be fixed by the PCIe protocol.
 - For Duplicate TLP, the controller initiates Data Link Retry by handling ACK DLLP as NAK DLLP. These TLPs will be duplicate TLPs at the receiver side.
 - For Nullified TLP, the TLPs that the controller transmits are changed into nullified TLPs and the original TLPs are stored in the retry buffer. The receiver of these TLPs will detect the lack of seq# and send NAK DLLP at the next TLP. Then the original TLPs are sent from retry buffer and the data controls are recovered. For 128 bit controller or more than 128 bit, the controller inserts errors the number of times of EINJ5_COUNT but does not ensure that the errors are continuously inserted into TLPs.

3.33.15 EINJ6_COMPARE_POINT_Hi_REG (for $i = 0; i \leq 3$)

- **Name:** Error Injection Control 6 (Compare Point Header DWORD #0).
- **Description:** Program this register for the 1st DWORD of TLP header/prefix. It is necessary to carefully consider the endianness when you program this register.
 Bits [31:0] = TLP_DW0[7:0], TLP_DW0[15:8], TLP_DW0[23:16], TLP_DW0[31:24]
 The Packet Compare Point registers (EINJ6_COMPARE_POINT*) specify which Tx TLP header bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. The type and number of errors are specified by the EINJ6_TLP_REG register.

3.33.19 EINJ6_TLP_REG

- **Name:** Error Injection Control 6 (Packet Error).
- **Description:**

The Packet Compare Point registers (EINJ6_COMPARE_POINT*) specify which Tx TLP header bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. The type and number of errors are specified by the this register.

The Packet Change Point registers (EINJ6_CHANGE_POINT*) specify which Tx TLP header bits to replace with the corresponding bits in the Packet Change Value registers (EINJ6_CHANGE_VALUE*). The type and number of errors are specified by the this register. Only applies when EINJ6_INVERTED_CONTROL in this register =0. The TLP into that errors are injected will not arrive at the transaction layer of the remote device when all of the following conditions are true.

 - Using 128b/130b encoding

Table 3-206 Fields for Register: SD_CONTROL1_REG

Bits	Name	Memory Access	Description
31:24	RSVDP_24	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
23:22	LOW_POWER_INTERVAL	R/W	Low Power Entry Interval Time. Interval Time that the controller starts monitoring RXELECIDLE signal after L0s/L1/L2 entry. You should set the value according to the latency from receiving EIOS to, RXELECIDLE assertion at the PHY. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (_40NS): 40ns ■ 0x1 (_160NS): 160ns ■ 0x2 (_320NS): 320ns ■ 0x3 (_640NS): 640ns Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
21:20	TX_EIOS_NUM	R/W	Number of Tx EIOS. This register sets the number of transmit EIOS for L0s/L1 entry and Disable/Loopback/Hot-reset exit. The controller selects the greater value between this register and the value defined by the PCI-SIG specification. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (G2_2_EIOS_OTHER_SPEED_1_EIOS): (2.5GT/s, 8.0GT/s or higher) 1 or (5.0GT/s) 2 ■ 0x1 (G2_8_EIOS_OTHER_SPEED_4_EIOS): (2.5GT/s, 8.0GT/s or higher) 4 or (5.0GT/s) 8 ■ 0x2 (G2_16_EIOS_OTHER_SPEED_8_EIOS): (2.5GT/s, 8.0GT/s or higher) 8 or (5.0GT/s) 16 ■ 0x3 (G2_32_EIOS_OTHER_SPEED_16_EIOS): (2.5GT/s, 8.0GT/s or higher) 16 or (5.0GT/s) 32 Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
19:17	RSVDP_17	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
16	FORCE_DETECT_LANE_EN	R/W	Force Detect Lane Enable. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When this bit is set, the controller ignores receiver detection from PHY during LTSSM Detect state and uses FORCE_DETECT_LANE. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
15:0	FORCE_DETECT_LANE	R/W	Force Detect Lane. This field is a bit vector of lanes to force receiver detection on. When the FORCE_DETECT_LANE_EN field is set, the controller ignores receiver detection from PHY during LTSSM Detect state and uses this value instead. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When this bit is set and the LTSSM is in Recovery Idle State, the LTSSM transitions to Configuration state. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
7:3	RSVDP_3	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
2	NOACK_FORCE_LINKDOWN	R/W	Force LinkDown. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When this bit is set and the controller detects REPLY_NUM rolling over 4 times, the LTSSM transitions to Detect State. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
1	RECOVERY_REQUEST	W	Recovery Request. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When this bit is set to '1' in L0 or L0s, the LTSSM starts transitioning to Recovery State. This request does not cause a speed change or re-equalization. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
0	HOLD_LTSSM	R/W	Hold and Release LTSSM. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): As long as this field is '1', the controller stays in the current LTSSM. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

3.33.22 SD_STATUS_L1LANE_REG

- **Name:** Silicon Debug Status(Layer1 Per-lane).
- **Description:** This viewport register returns the data selected by the following field:
 - LANE_SELECT in SD_STATUS_L1LANE_REG
 For more information, see the RAS DES section in the Controller Operations chapter of the *Databook*.
- **Size:** 32 bits
- **Offset:** B+0xb0

7	FRAMING_ERR	R/W1C	Framing Error. Indicates Framing Error detection status. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && CX_GEN3_SPEED && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
6:0	FRAMING_ERR_PTR	R	First Framing Error Pointer. Identifies the first Framing Error using the following encoding. The field contents are only valid value when FRAMING_ERR = 1. ■ Received Unexpected Framing Token (Values 01h to 06h) ■ Received Unexpected STP Token (Values 11h to 13h) ■ Received Unexpected Block (Values 21h to 2Eh) All encodings other than the defined encodings are reserved. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (STP_OR_SDP_OR_IDL_RECEIVED_NO_TLP_OR_DLLP): When non- STP/SDP/IDL Token was received and it was not in TLP/DLLP reception ■ 0x2 (CURRENT_NO_VALID_EDB_PREVIOUS_VALID_EDB): When current token was not a valid EDB token and previous token was an EDB. (128/256 bit controller only) ■ 0x3 (SDP_RECEIVED_NOT_EXPECTED): When SDP token was received but not expected. (128 bit & (x8 x16) controller only) ■ 0x4 (STP_RECEIVED_NOT_EXPECTED): When STP token was received but not expected. (128 bit & (x8 x16) controller only) ■ 0x5 (EDS_RECEIVED_NOT_EXPECTED): When EDS token was expected but not received or whenever an EDS token was received but not expected. ■ 0x6 (FRE_ERR_DESKEW_PKT_IN_PROGRESS): When a framing error was detected in the deskew block while a packet has been in progress in token_finder. ■ 0x11 (CRC_STP_NOT_MATCH): When Framing CRC in STP token did not match

Bits	Name	Memory Access	Description
6:0...(cont.)	FRAMING_ERR_PTR.	R	0x12 (PARITY_STP_NOT_MATCH): When Framing Parity in STP token did not match. 0x13 (TLP_LENGTH_SMALLER_THAN_5DW): When Framing TLP Length in STP token was smaller than 5 DWORDs. 0x21 (RECEIVING_OS_AFTER_SDS_IN_DATA_STREAM): When Receiving an OS Block following SDS in Datastream state 0x22 (AFTER_DATA_BLK_OS_BLK_NOT_SKP_EI_EIE): When Data Block followed by OS Block different from SKP, EI, EIE in Datastream state 0x23 (UNDEFINE_BLK_TYPE): When Block with an undefined Block Type in Datastream state 0x24 (DATA_STREAM_WITHOUT_3_CYCLE_DATA_STREAM_S): When Data Stream without data over three cycles in Datastream state 0x25 (OS_BLK_DURING_DATA_STREAM): When OS Block during Data Stream in Datastream state 0x26 (RXSTATUS_ERR_DATA_STREAM_STATE): When RxStatus Error was detected in Datastream state
6:0...(cont.)	FRAMING_ERR_PTR..	R	0x27 (NOT_ALL_LANE_START_RECEIVING_SKP_OS_SAME_T): When Not all active lanes receiving SKP OS starting at same cycle time in SKPOS state 0x28 (2_BLK_TIMEOUT_SKP_OS_SKPOS_STATE): When a 2-Block timeout occurs for SKP OS in SKPOS state 0x29 (CONSECUTIVE_OS_WITHIN_DATA_IN_SKPOS_STATE): When Receiving consecutive OS Blocks within a Data Stream in SKPOS state 0x2a (PHYSTATUS_ERR_IN_SKPOS_STATE): When PHY status error was detected in SKPOS state 0x2b (NOT_ALL_LANE_START_RECEIVING_EIOS_SAME_T): When Not all active lanes receiving EIOS starting at same cycle time in EIOS state 0x2c (AT_LEAST_1_SYM_IS_NOT_EIOS_FROM_4_SYM): When At least one Symbol from the first 4 Symbols is not EIOS Symbol in EIOS state (CX_NB=2 only) 0x2d (NOT_ALL_LANE_START_RECEIVING_EIEOS_SAME_T): When Not all active lanes receiving EIEOS starting at same cycle time in EIEOS state
6:0...(cont.)	FRAMING_ERR_PTR...	R	0x2e (NOT_16_EIEOS_SYM_RECEIVED): When Not full 16 eieos symbols are received in EIEOS state Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && CX_GEN3_SPEED && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
31:24	RSVDP_24	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
23:16	LATCHED_NFTS	R	Latched N_FTS. Indicates the value of N_FTS in the received TS Ordered Sets from the Link Partner. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
15:13	L1SUB_STATE	R	L1Sub State. Indicates internal state machine of L1Sub state. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (S_L1_U): S_L1_U : idle state ■ 0x1 (S_L1_0): S_L1_0 : wait for aux_clk_active ■ 0x2 (S_L1_0_WAIT4_ACK): S_L1_0_WAIT4_ACK : wait for pclkack ■ 0x3 (S_L1_0_WAIT4_CLKREQ): S_L1_0_WAIT4_CLKREQ : wait for clkreq ■ 0x4 (S_L1_N_ENTRY): S_L1_N_ENTRY : check clkreq_in_n is de-asserted for t_power_off time (only for L1.2, reduces to one cycle for L1.1) ■ 0x5 (S_L1_N): S_L1_N : L1 substate, turn off txcommon-mode circuits (L1.2 only) and rx electrical idle detection circuits ■ 0x6 (S_L1_N_EXIT): S_L1_N_EXIT : locally/remotely initiated exit, assert pclkreq, wait for pclkack ■ 0x7 (S_L1_N_ABORT): S_L1_N_ABORT : wait for pclkack when aborting an attempt to enter L1_N Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && CX_L1_SUBSTATES_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
12	PME_RESEND_FLAG	R/W1C	PME Re-send flag. When the DUT sends a PM_PME message TLP, the DUT sets PME_Status bit. If host software does not clear PME_Status bit for 100ms(+50%/-5%), the DUT resends the PM_PME Message. This bit indicates that a PM_PME was resent. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
11:8	INTERNAL_PM_SSTATE	R	Internal PM State(Slave). Indicates internal state machine of Power Management Slave controller. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (S_IDLE): S_IDLE ■ 0x1 (S_RESPOND_NAK): S_RESPOND_NAK ■ 0x2 (S_BLOCK_TLP): S_BLOCK_TLP ■ 0x3 (S_WAIT_LAST_TLP_ACK): S_WAIT_LAST_TLP_ACK ■ 0x4 (S_WAIT_EIDLE): S_WAIT_EIDLE ■ 0x5 (S_LINK_ENTR_L1): S_LINK_ENTR_L1 ■ 0x6 (S_L1): S_L1 ■ 0x7 (S_L1_EXIT): S_L1_EXIT ■ 0x8 (S_L23RDY): S_L23RDY ■ 0x9 (S_LINK_ENTR_L23): S_LINK_ENTR_L23 ■ 0xa (S_L23RDY_WAIT4ALIVE): S_L23RDY_WAIT4ALIVE ■ 0xb (S_ACK_WAIT4IDLE): S_ACK_WAIT4IDLE ■ 0xc (S_WAIT_LAST_PMDLLP): S_WAIT_LAST_PMDLLP Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

3.33.26 SD_STATUS_L3FC_REG

- **Name:** Silicon Debug Status(Layer3 FC).
 - **Description:** The CREDIT_DATA[0/1] fields in this viewport register return the data for the VC and TLP Type selected by the following fields:
 - ❑ CREDIT_SEL_VC
 - ❑ CREDIT_SEL_CREDIT_TYPE
 - ❑ CREDIT_SEL_TLP_TYPE
 - ❑ CREDIT_SEL_HD
- SD_STATUS_L3FC_REG returns the header credit [7:0] (CREDIT_SEL_HD =0) and the data credit [11:0] (CREDIT_SEL_HD =1) even when the Scaled FC is supported. For more information, see the RAS DES section in the Controller Operations chapter of the *Databook*.

3.33.31 SD_EQ_STATUS1_REG

- **Name:** Silicon Debug EQ Status 1.
 - **Description:** This viewport register returns the first of three words of Silicon Debug EQ Status data for the rate and lane selected by the EQ_RATE_SEL and EQ_LANE_SEL fields in the SD_EQ_CONTROL1_REG register. The following fields are available when Equalization finished unsuccessfully (EQ_CONVERGENCE_INFO=2).
 - EQ_RULEA_VIOLATION
 - EQ_RULEB_VIOLATION
 - EQ_RULEC_VIOLATION
 - EQ_REJECT_EVENT
- For more information, see the RAS DES section in the Controller Operations chapter of the *Databook*.

Bits	Name	Memory Access	Description
7	EQ_REJECT_EVENT	R	EQ Reject Event. Indicates that the controller receives two consecutive TS1 OS w/Reject=1b during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). This bit is automatically cleared when the controller starts EQ Master phase again. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_RAS_DES_SD_ENABLE && CX_GEN3_SPEED && (CX_RAS_DES_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
6	EQ_RULEC_VIOLATION	R	EQ Rule C Violation. Indicates that coefficients rule C violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rule C correspond to the rules c) from section "Rules for Transmitter Coefficients" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. <i>Note:</i> This register field is sticky. 3.34 PF_VSECRAS_CAPI Registers

3.34.1 RASDP_EXT_CAP_HDR_OFF

- **Name:** PCIe Extended capability ID, Capability version and Next capability offset.
- **Description:** This Register provides capability ID, Capability version, and Next capability offset for PCIe Extended capability stucture.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CX_RAS_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

NEXT_OFFSET	31:20
CAP	19:16
ID	15:0

Table 3-220 Fields for Register: RASDP_EXT_CAP_HDR_OFF

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xfff (MAX_VAL): Max value Value After Reset: Pointer value calculated at configuration time. Exists: (CX_RAS_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. A version of the specification that changes the Extended Capability in a way that is not otherwise identifiable (e.g., through a new Capability field) is permitted to increment this field. All such changes to the Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as Functions reporting any such Capability Version numbers will contain a Capability structure that is compatible with that piece of software. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xf (MAX_VAL): Max value Value After Reset: 0x1 Exists: (CX_RAS_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
15:0	ID	* Varies	PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffff (MAX_VAL): Max value Value After Reset: 0xb Exists: (CX_RAS_EN && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

3.34.2 RASDP_VENDOR_SPECIFIC_HDR_OFF

- **Name:** Vendor Specific Header.
- **Description:** This Register provides VSEC Length, VSEC ID and VSEC Rev (Version Number). Vendor-specific software must qualify the associated Vendor ID of the PCI Express Function or RCRB before attempting to interpret the values in the VSEC ID or VSEC Rev fields.
- **Size:** 32 bits
- **Offset:** B+0x4

3.34.3 RASDP_ERROR_PROT_CTRL_OFF

- **Name:** ECC Error Correction and Control Register.
- **Description:** Allows you to disable ECC error correction for RAMs and datapath.
When the AXI Bridge Module is implemented and the master / slave clocks are asynchronous to the PCIe native controller clock (core_clk), you must not write this register while operations are in progress in the AXI master / slave interface.

3.34.11 RASDP_ERROR_MODE_EN_OFF

- **Name:** RASDP error mode enable. The controller enters RASDP error mode (if ERROR_MODE_EN =1) upon detection of the first uncorrectable error.
- **Description:** RASDP error mode enable. The controller enters RASDP error mode (if ERROR_MODE_EN =1) upon detection of the first uncorrectable error. During this mode:
 - The controller sets cfg_rasdp_error_mode =1 (or mstr_rasdp_error_mode and slv_rasdp_error_mode when AXI bridge is used). When the AXI Bridge Module is implemented and the master / slave clocks are asynchronous to the PCIe native controller clock (core_clk), you must not write this register while operations are in progress in the AXI master / slave interface.
 - Rx TLPs that are forwarded to your application are not guaranteed to be correct; you must discard them.

For more information, see the RAS Data Protection (DP) section in the Controller Operations chapter of the *Databook*.

Table 3-234 Fields for Register: DATA_LINK_FEATURE_EXT_HDR_OFF

Bits	Name	Memory Access	Description
31:20	DLINK_NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h, if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (FC_SCALE_EN && (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
19:16	DLINK_CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field depends on the version of the specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
15:8	PTM_CLK_GRAN	* Varies	PTM Local Clock Granularity. For other than this value (between b00000001-b11111110) indicates the period of this Time Source's local clock in ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy. This field is reserved for Functions that do not implement the PTM Time Source role. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RSVDP ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Values: ■ 0x0 (No_local_clock): Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. ■ 0xff (Greater_than_254ns): Indicates the period of this Time Source's local clock is greater than 254 ns. Value After Reset: {(CX_PTM_ROOT_CAPABLE==1) ? Table 3-239 Fields for Register: PTM_CONTROL_OFF

Bits	Name	Memory Access	Description
31:16	RSVDP_16	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
15:8	EFF_GRAN	* Varies	PTM Effective Granularity. For Functions implementing the PTM Requester Role, this field provides information relating to the expected accuracy of the PTM clock, but does not otherwise affect the PTM mechanism. For Endpoints, system software must program this field to the value representing the maximum Local Clock Granularity reported by the PTM Root and all intervening PTM Time Sources. For RCiEPs, system software must set this field to the value reported in the Local Clock Granularity field by the associated PTM Time Source. For other than this value (between b00000001-b111111110) indicates the effective PTM granularity in ns. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: HWINIT Values: ■ 0x0 (No_local_clock): Unknown PTM granularity - one or more Switches between this Function and the PTM Root reported a Local Clock Granularity value of 0000 0000b. ■ 0xff (Greater_than_254ns): Indicates the effective PTM granularity is greater than 254 ns. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
1	ROOT_SELECT	* Varies	PTM Root Select. If the value of the PTM Root Capable bit is 0b, this bit is permitted to be hardwired to 0b by the controller. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: HWINIT Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""
0	PTM_ENABLE	R/W	PTM Enable. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role(s). Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
31:17	RSVDP_17	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<=2))
16	PTM_REQ_PDEL_BYTE_REV	R/W	PTM Requester Propagation Delay Byte Reversal. Reverse the order of bytes in the PTM Propagation Delay data word of the PTM ResponseD Message, for compatibility with previous revisions. For more information, see the PTM section in the <i>Databook</i> . <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<=2)) Testable: writeAsRead

Bits	Name	Memory Access	Description
15:8	PTM_REQ_LONG_TIMER	R/W	PTM Requester Long Timer. Determines the period between each auto update PTM Dialogue in milliseconds. Update period is the register value +1 millisecond. For the Switch product this value must not be set larger than 0x9 for spec compliance. For more information, see the PTM section in the <i>Databook</i>. <i>Note:</i> This register field is sticky. 2	PTM_REQ_FAST_TIMERS	R/W	PTM Fast Timers (Debug mode for PTM Timers). The 100us timer output will go high at 30us and the 10ms timer output will go high at 100us (the Long Timer Value is ignored). There is no change to the 1us timer. The requester operation will otherwise remain the same. For more information, see the PTM section in the <i>Databook</i>. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<=2)) Testable: writeAsRead
1	PTM_REQ_START_UPDATE	R/W1C	PTM Requester Start Update. For more information, see the PTM section in the <i>Databook</i>. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): When set, the PTM Requester will attempt a PTM Dialogue to update its context; This bit is self clearing. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<=2)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
0	PTM_REQ_AUTO_UPDATE_ENABLED	R/W	PTM Requester Auto Update Enabled. For more information, see the PTM section in the <i>Databook</i>. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): When enabled PTM Requester will automatically attempt to update its context every 10ms. Value After Reset: 0x0 Exists: (CX_PTM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE<=2)) Testable: writeAsRead

Bits	Name	Memory Access	Description
28:26	QUICK_EQ_TIMEOUT	R/W	QuickEqualizationTimeoutSelect. Defined encodings are: All other encodings are Reserved. The default value of this field is equal to a value in CCIXLinkTransportCapabilities.ESMQuickEqualizationTimeout. For Data Rates higher than 16.0 GT/s, if CCIXTransportCapabilities.ESMQuickEqualizationTimeout is greater than 000b, setting QuickEqualizationTimeoutSelect to value greater than 000b causes the corresponding QuickEqualizationTimeout value to be used during the Recovery Equalization Phase2/Phase3 to Recovery Speed transition in place of the Timeouts specified in the ESMControl.ESMExtendedEqualizationPhase2Timeout and ESMControl.ESMExtendedEqualizationPhase3Timeout fields. Setting QuickEqualizationTimeoutSelect to 000b disables the Quick Equalization mechanism. If the QuickEqualizationTimeoutSelect field is to be programmed to a non-zero value, it must be programmed to an encoding corresponding to a Timeout equal to or greater than that advertised in CCIXTransportCapabilities.ESMQuickEqualizationTimeout, otherwise the resulting behaviour is undefined. Setting ESMControl.QuickEqualizationTimeoutSelect to a value other than 000b has no effect on behaviour if CCIXTransportCapabilities.ESMQuickEqualizationTimeout is 000b. See Implementation Note "ESM Control Register Quick Equalization Timeout Select field" for usage guidelines. Values: ■ 0x0 (DISABLED): Quick Equalization is Disabled ■ 0x1 (_8_TO_16_MS): 8 ms / 16 ms ■ 0x2 (_24_TO_32MS): 24 ms / 32 ms ■ 0x3 (_50_TO_58MS): 50 ms / 58 ms ■ 0x4 (_100_TO_108MS): 100 ms / 108 ms ■ 0x5 (_200_TO_208MS): 200 ms / 208 ms Value After Reset: {DEFAULT_CX_CCIX_ESM_QUICK_EQ_TIME} Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE

24	LINK_REACH_TARGET	R/W	LinkReachTarget. This bit indicates the Reach Length Target of current link. Defined encodings are: When ESMCompliance is Set, this field is RWS, else it is RW. The default value of this bit is 0b. SSW should configure this bit to indicate the target reach length of the Link before initiating the ESM physical layer calibration, based on the platform channel capability (Compliance to SR or LR) and ESMPHYReachLengthCapability of the DSP and USP. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (SR): Reach Length Target of current link is Short Reach (SR) ■ 0x1 (LR): Reach Length Target of current link is Long Reach (LR) Value After Reset: 0x0 Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE Testable: writeAsRead Volatile: true

22:20	ESM_EXT_EQ3_DSP_TIMEOUT	R/W	ESMExtendedEqualizationPhase3Timeout. LTSSM Equalization Phase3 Timeout For Downstream Port / Upstream Port when the current data rate is higher than 16.0 GT/s. Defined encodings are: All other encodings are Reserved. 1. For a DSP, if CCIXTransportCapabilities.ESMPHYReachLengthCapability is a defined value other than 00b, hardware must initialize this field to indicate its Equalization Phase3 Timeout requirement, for a Long Reach Link during ESM Data Rate1 link initialization. 2. For a DSP, if CCIXTransportCapabilities.ESMPHYReachLengthCapability is 00b (PHY is only Short Reach Capable), hardware must initialize this field to 000b 3. For an USP, SSW must program this field taking into account the value of the LinkReachTarget bit and the requested value of ESM Extended Equalization Phase3 Timeout value from the DSP. Values: ■ 0x0 (_24_TO_32MS): 24 ms / 32 ms ■ 0x1 (_50_TO_58MS): 50 ms / 58 ms ■ 0x2 (_100_TO_108MS): 100 ms / 108 ms ■ 0x3 (_200_TO_208MS): 200 ms / 208 ms ■ 0x4 (_400_TO_408MS): 400 ms / 408 ms ■ 0x5 (_600_TO_608MS): 600 ms / 608 ms Value After Reset: DEFAULT_CX_CCIX_ESM_EXT_EQ3_DSP_TIMEOUT Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE

Bits	Name	Memory Access	Description
15	ESM_ENABLE	R/W	ESMEnable. When the bit is 0b, a write of 1b initiates the transition to ESM, when the Link is operating at 2.5 GT/s or 5.0 GT/s, and the Link is operating in PCI Express Mode. When the bit is 0b, writing this bit to 1b when the Data Rate is not 2.5 GT/s, or not operating in PCI Express Mode, produces undefined results. When system software program (set or reset) it from DSP, the software must program it to the remote USP first and then program it to the local DSP. When ESMCompliance is Set, this field is RWS, else it is RW. Default value of this bit is 0b. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE Testable: writeAsRead Volatile: true
14:8	ESM_DATA_RATE1	R/W	ESMDataRate1. Sets the ESM Data Rate to be used instead of normal 16.0 GT/s. Programmed by SSW before entering ESM. The programmed data rate must be a supported data rate in either the ESMandatoryDataRateCapability or ESMOptionalDataRateCapability registers, otherwise the result is undefined. Defined encodings are: All other encodings are Reserved. When ESMCompliance is Set, this field is RWS, else it is RW. Default value of this field is b0000000. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NO_SPEED): No Speed ■ 0x6 (_16GT): 16.0 GT/s ■ 0xa (_20GT): 20.0 GT/s ■ 0xf (_25GT): 25.0 GT/s Value After Reset: 0x0 Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
7	ESM_PERFORM_CAL	W	ESMPerformCalibration. A write of 1b initiates the start of physical layer calibration before transition to ESM. Physical layer calibration is performed after the Link has transitioned to a non-D0 state through Programmed Power Management (Link enters the LTSSM L1 state when idle). Hardware sets ESMStatus.ESMCalibrationComplete to indicate that physical layer calibration is complete. When ESMCompliance is Set, this field is RWS, else it is RW. This bit always returns 0b when read. Value After Reset: 0x0 Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE Testable: writeAsRead Volatile: true
6:0	ESM_DATA_RATE0	R/W	ESMDataRate0. Sets the ESM Data Rate to be used in place of normal 8.0 GT/s. Programmed by SSW before entering ESM. The programmed data rate must be a supported data rate in either the ESMandatoryDataRateCapability or ESMOptionalDataRateCapability registers, otherwise the result is undefined. Defined encodings are: All other encodings are Reserved. When ESMCompliance is Set, this field is RWS, else it is RW. Default value of this field is 000 0000b. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NO_SPEED): No Speed ■ 0x3 (_8GT): 8.0 GT/s ■ 0x6 (_16GT): 16.0 GT/s Value After Reset: 0x0 Exists: (CX_CCIX_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_CCIX_ENABLE Testable: writeAsRead Volatile: true

7:4	ESM_USP_TX_PRESET_20G_0	* Varies	UpstreamPortESMTransmitterPreset. Field contains the Transmit Preset value sent or received during ESM Link Equalization. The field usage varies as follows: ■ Case A: If Operating port direction is Downstream Port, and Crosslink Supported is Any, □ This field contains the value sent on the associated Lane during Link Equalization. □ Field is HwInit. ■ Case B: If Operating port direction is Upstream Port, and Crosslink Supported is 0b, □ Field is intended for debug and diagnostics. It contains the value captured from the associated Link during Link Equalization. □ Field is RO. □ When crosslinks are supported, case C applies and this captured information is not visible to software. □ Vendors are encouraged to provide an alternate mechanism to obtain this information. ■ Case C: If Operating port direction is Upstream Port, and Crosslink Supported is 1b, □ Field is not used or affected by the current Link Equalization. □ Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. □ Field is HwInit. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: RSVDP Value After Reset: <code>{(CX_MEMORY_MAP_POSITION==1 CX_CROSSLINK_ENABLE==1) ? 3.40 PF_VSECDMA_CAPI Registers

3.40.1 VSECDMA_EXT_CAP_HDR_OFF

- **Name:** PCIe Extended Capability ID, Capability Version, and Next Capability Offset Register.
- **Description:** This register provides capability ID, capability version, and next capability offset for PCIe extended capability structure.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

31:20	19:16	15:0
NEXT_OFFSET	CAP	ID

Table 3-285 Fields for Register: VSECDMA_EXT_CAP_HDR_OFF

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. A version of the specification that changes the Extended Capability in a way that is not otherwise identifiable (that is, through a new Capability field) is permitted to increment this field. All such changes to the Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as Functions reporting any such Capability Version numbers will contain a Capability structure that is compatible with that piece of software. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
15:0	ID	* Varies	PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0xb Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

3.40.2 VSECDMA_VENDOR_SPECIFIC_HDR_OFF

- **Name:** Vendor Specific Header Register.
- **Description:** This Register provides VSEC Length, VSEC ID, and VSEC Rev (Version Number). Vendor-specific software must qualify the associated Vendor ID of the PCI Express Function or RCRB before attempting to interpret the values in the VSEC ID or VSEC Rev fields.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Table 3-286 Fields for Register: VSECDMA_VENDOR_SPECIFIC_HDR_OFF

Bits	Name	Memory Access	Description
31:20	VSEC_LENGTH	R	VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Value After Reset: 0x18 Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
19:16	VSEC_REV	R	VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
15:0	VSEC_ID	R	VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Value After Reset: 0x6 Exists: (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.40.3 VSECDMA_DEVICE_INFORMATION_OFF

- **Name:** DMA and related AXI Bridge Implementation Information.
- **Description:** This register provides DMA and AXI Bridge implementation-specific information:
 - DMA Architecture: Legacy DMA or Hyper DMA (HDMA).
 - Register Location: Port-logic or Mapped to a Function and BAR.
 - Register Map: Legacy DMA or HDMA.
 - Channel Separation: Address distance between read and write channels.
 - AXI Bridge: Used or Not Used
 - AXI Master Bus Specification: AXI Master Bus Width, Burst Length, and Boundary Pointer Width
 You must use this information along with the IP version registers:
 - PCIE_VERSION_NUMBER_OFF
 - PCIE_VERSION_TYPE_OFF
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** (CC_DMA_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

4	NPEM_FAIL_CAPABLE	* Varies	NPEM Fail Capable. When Set, this bit indicates that the enclosure has the ability to indicate the NPEM Fail state. When Clear, this bit indicates that the enclosure has not the ability to indicate the NPEM Fail state. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: NPEM_ENABLE Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead
3	NPEM_LOCATE_CAPABLE	* Varies	NPEM Locate Capable. When Set, this bit indicates that the enclosure has the ability to indicate the NPEM Locate state. When Clear, this bit indicates that the enclosure has not the ability to indicate the NPEM Locate state. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: NPEM_ENABLE Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead
2	NPEM_OK_CAPABLE	* Varies	NPEM OK Capable. When Set, this bit indicates that the enclosure has the ability to indicate the NPEM OK state. When Clear, this bit indicates that the enclosure has not the ability to indicate the NPEM OK state. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: NPEM_ENABLE Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
1	NPEM_RESET_CAPABLE	* Varies	NPEM Reset Capable. When Set, this bit indicates support for the NPEM Reset mechanism functionality. When Clear, this bit indicates no support for the NPEM Reset mechanism functionality. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: NPEM_ENABLE Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead
0	NPEM_CAPABLE	* Varies	NPEM Capable. When Set, this bit indicates that the enclosure has NPEM functionality. When Clear, this bit indicates that the enclosure has not NPEM functionality. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: NPEM_ENABLE Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

3.41.3 NPEM_CTRL_OFF

- **Name:** NPEM Control Register.
- **Description:** Native PCIe Enclosure Management Control Register contains an overall NPEM Enable bit and a bit map of states that software controls.
- **Size:** 32 bits
- **Offset:** B+0x8

1	NPEM_INITIATE_RESET	R	NPEM Initiate Reset. One-shot pulse that initiates the NPEM Reset. The value read by software from this bit is always 0b. If NPEM Reset Capable bit in NPEM capability Register is 1b, then a write of 1b to this bit initiates NPEM Reset. If NPEM Reset Capable bit in NPEM capability Register is 0b, then this bit is read-only with a value of 0b. Values: ■ 0x1 (SET): NPEM Reset Initiated. ■ 0x0 (CLEAR): Clear. Value After Reset: 0x0 Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
0	NPEM_ENABLE	R/W	NPEM Enable. Values: ■ 0x1 (SET): When Set, this bit enables the NPEM capability. ■ 0x0 (CLEAR): When Clear, this bit disables the NPEM capability. Value After Reset: 0x0 Exists: (NPEM_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Table 3-295 Fields for Register: DEV3_EXT_CAP_HDR_REG

Bits	Name	Memory Access	Description
31:20	DEV3_CAP_NEXT_OFFSET	* Varies	DEV3 Next Capability Pointer. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (DEV3_CAP_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	DEV3_CAP_VERSION	* Varies	DEV3 Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
0	DEV3_CAP_DMWR_ROUTING_S UPP	R	Deferrable Memory Write (DMWr) Request Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more details, see section 6.30 of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: (DEV3_CAP_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.42.3 DEVICE_CONTROL3_REG

- **Name:** DEV3 Control Register.
- **Description:** Device 3 Control Register provides various controls the device as a deferrable memory write requester and it's egress blocking feature.

Bits	Name	Memory Access	Description
1	DEV3_CAP_DMWR_EGRESS_BLOCK	R	Deferrable Memory Write (DMWr) Egress Blocking. Applicable and mandatory for Switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement DMWr routing; otherwise the controller hardwires this bit to 0b. When this bit is set, DMWr Requests that target going out this Egress Port must be blocked. For more details, see section 6.30 of <i>PCI Express Base Specification</i>. Reflected on the <code>cfg_dmwr_egress_block</code> output. Value After Reset: 0x0 Exists: <code>CX_DEF_MEM_WR_ENABLE && (DEV3_CAP_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))</code>
0	DEV3_CAP_DMWR_REQ_EN	R/W	Deferrable Memory Write (DMWr) Requester Enable. Applicable only to Endpoints and Root Ports; otherwise the controller hardwires this bit to 0b for other Function types. The Function is allowed to initiate Deferrable Memory Writes only if this bit and the Bus Master Enable bit in the Command register are both Set. This bit is RW if the Endpoint or Root Port is capable of initiating Deferrable Memory Write Requests, but otherwise the controller hardwires to 0b. For more details, see Section 6.30 of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: <code>(CX_DEF_MEM_WR_REQ_SUP && CX_DEF_MEM_WR_ENABLE && CC_DEVICE_TYPE!=3) && (DEV3_CAP_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))</code>

3.43 PF0_CXL_PORT_CAP Registers

3.43.1 CXL_RCRB_PCIE_EXT_CAP_HDR_OFF

- **Name:** Capability ID, Version ID, Next offset pointer.
- **Description:** This Register Field for Flex Bus Port DVSEC Registers with Capability ID, Version and Next Offset Pointer.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE < 2))

Table 3-298 Fields for Register: CXL_RCRB_PCIE_EXT_CAP_HDR_OFF

Bits	Name	Memory Access	Description
31:20	FLEX_BUS_PORT_NXT_OFFSET	* Varies	FLEX BUS PORT DVSEC Next Capability Offset. This field contains the offset to the next PCI Express DVSEC PORT Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE < 2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	FLEX_BUS_PORT_CAP_VERSION	* Varies	PCI Express Extended capability Version. This field is a PCIe DVSEC PORT defined version number that indicates the version of the capability structure present. This field is depends on the version of specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
15:0	FLEX_BUS_PORT_CAP_ID	* Varies	PCI Express Extended Capability ID. This PCIe DVSEC PORT defined ID number that indicates the nature and format of the extended capability. And this Device Capability ID field has read-write attribute and sticky reset type for the offset value 00h with [15:0] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x23 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

3.43.2 CXL_RCRB_DVSEC_PORT_HDR_1_OFF

- **Name:** DVSEC Header 1: Vendor ID, Revision, Length.
- **Description:** Register Fields for Flex Bud Port DVSEC Registers: Designated Vendor Specific Header 1.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2))

15:0	CXL_RCRB_DVSEC_VNDR_ID

Table 3-299 Fields for Register: CXL_RCRB_DVSEC_PORT_HDR_1_OFF

Bits	Name	Memory Access	Description
31:20	CXL_RCRB_DVSEC_LEN	* Varies	FLEX BUS PORT DVSEC HEADER 1 Length. The DVSEC Legth field is set to 16 bytes to accomodate the Flex Bus PORT registers included in the DVSEC. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x14 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CXL_RCRB_DVSEC_REV	* Varies	FLEX BUS PORT DVSEC HEADER 1 REVISION. the DVSEC revision field is set to 0x0 to show that this is an FLEX Bus PORT DVSEC feature specific header capability structure. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE < 2)) Testable: wire ? unconstrained : writeAsRead
15:0	CXL_RCRB_DVSEC_VNDR_ID	* Varies	PCI Express Extended Capability vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1e98 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE < 2)) Testable: wire ? unconstrained : writeAsRead

3.43.3 CXL_RCRB_DVSEC_HDR_2_FLEXBUS_CAP_OFF

- **Name:** DVSEC HEADER 2 and DVSEC Flex Bus Port Capability.
- **Description:** this register field consists DVSEC Hdr 2 and Flex Bus Port capability.

31:23	RSVDP_23	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2))

Bits	Name	Memory Access	Description
22	CXL_MUL_LOG_DEV_CAP	* Varies	CXL MULTI LOGICAL DEVICE CAPABLE. If set, indicates Multi-Logical Device support available when operating in Flex Bus.CXL mode. This bit is reserved on CXL1.1 components. This bit should be set to 1'b0 on CXL2.0 host Downstream ports. The value must be the same for all functions of an MLD. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
18	MEM_CAP	* Varies	MEMORY CAPABLE. If set, indicates CXL.mem protocol support when operating in Flex Bus.AL mode. It's at bit 2 at offset 0x0Ah with read-only wire attribute. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: "(CX_CXL_MEM_EN) ? 1 : 0" Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
17	IO_CAP	R	IO CAPABLE. If set, indicates CXL.io protocol support when operating in Flex Bus.AL mode. Must be 1. It's bit value is 1 as read only wire-attribute. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))
16	CACHE_CAP	* Varies	CACHE CAPABLE. If set, indicates CXL.cache protocol support when operating in Flex Bus.AL mode. It's offset value is 0x0A with 0 bit. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Table 3-301 Fields for Register: CXL_RCRB_FLEXBUS_CNTRL_STATUS_OFF

Bits	Name	Memory Access	Description
31:29	RSVDP_29	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2))

Bits	Name	Memory Access	Description
28	CXL_FB_EN_BITS_P2_MISMATCH_H	R	FlexBusEnableBits_Phase2_Mismatch. When set, indicates that the downstream port physical layer detected that the upstream port did not reflect precisely the Flex Bus enable bits located in symbols 12-14 of the modified TS2 during Phase 2 of the negotiation. Please refer to Section 6.3.1.1 for more details. This bit is reserved on upstream ports. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))
27	CXL_RETIMER_PSNT_MISMATCH_H	R	CXL_Retimers_Present_Mismatched. When set, indicates that the downstream port physical layer detected an inconsistency in the "Retimers Present" or "Two Retimers Present" bits in the received TS2 Ordered Sets during Polling.Config versus Config.Complete LTSSM states. The physical layer will force disable of the sync header bypass optimization when this error condition has been detected. See Section 6.3.1.2.1 for more details. This bit is reserved on upstream ports. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
26	CXL_UNEXP_PROT_ID_DROP	R/W1C	CXL UNEXPECTED PROTOCOL ID DROPPED. When set, indicates that the physical layer dropped a flit with an unexpected protocol ID that is not due to an Uncorrectable Protocol ID Framing Error. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))
25	CXL_UNCORR_PROT_ID_FRAMING_ERROR	R/W1C	CXL UNCORRECTABLE PROTOCOL ID FRAMING ERROR. An 8-bit encoding with a hamming distance of four is replicated to create the 16-bit encoding for error protection against bit flips. If both 8-bit encoding groups are incorrect, an uncorrectable protocol ID framing error is logged, the flit is dropped, and the physical layer enters into recovery to retrain the link. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))

Bits	Name	Memory Access	Description
24	CXL_CORR_PROT_ID_FRAMING_ERROR	R/W1C	CXL CORRECTABLE PROTOCOL ID FRAMING ERROR. An 8-bit encoding with a hamming distance of four is replicated to create the 16-bit encoding for error protection against bit flips. A correctable protocol ID framing error is logged but no further error handling action is taken if only one 8-bit encoding group looks incorrect; the correct 8-bit encoding group is used for normal processing. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))
23	RSVDP_23	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2))
22	CXL_MLD_END	R	When set, indicates that CXL Multi-Logical Device operation has been negotiated. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
21	CXL2P0_ENABLED	R	When set, indicates that CXL2.0 protocol operation has been enabled as a result of PCIe alternate protocol negotiation for Flex Bus. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
20	DRIFT_BUF_END	R	DRIFT BUFFER ENABLED. When set, indicates that the physical layer has enabled its drift buffer instead of its elastic buffer. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
19	CXL_SYNC_HDR_BYPASS_END	R	CXL SYNCHRONOUS BYPASS ENABLED. When set, indicates that bypass of the 2-bit sync header by the Flex Bus physical layer has been enabled when operating in Flex Bus.AL mode as a result of PCIe alternate protocol negotiation for Flex Bus. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
18	MEM_END	R	MEMORY ENABLED. When set, indicates that CXL.mem protocol operation has been enabled as a result of PCIe alternate protocol negotiation for Flex Bus. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
17	IO_END	R	IO ENABLED. When set, indicates that CXL.io protocol operation has been enabled as a result of PCIe alternate protocol negotiation for Flex Bus. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
16	CACHE_END	R	CACHE ENABLED. When set, indicates that CXL.cache protocol operation has been enabled as a result of PCIe alternate protocol negotiation for Flex Bus. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
15:10	RSVDP_10	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2))

Bits	Name	Memory Access	Description
9	RETIMER_2_PRESENT	* Varies	RETIMER 2 PRESENT. When set, indicates presence of retimer2. This bit is defined only for a downstream port. This bit is reserved for an upstream port. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: R Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_POSITION==1) ? \"read-write\" : \"read-only\" "
8	RETIMER_1_PRESENT	* Varies	RETIMER 1 PRESENT. When set, indicates presence of retimer1. This bit is defined only for a downstream port. This bit is reserved for an upstream port. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: R Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_POSITION==1) ? \"read-write\" : \"read-only\" "

Bits	Name	Memory Access	Description
7	DISABLE_CXL_L1P1_TRAINING	* Varies	When set, CXL1.0 training is disabled. Typical usage model is that BIOS will use this bit to disable hot plug of CXL1.1 devices below a CXL2.0 Downstream Port. This bit should default to 1'b0. This bit is reserved on all CXL Upstream ports and on CXL1.1 components. Default value of this field is 0. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: 0x0 Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
6	CXL_MLD_EN	* Varies	When set, enable Multi-Logical Device operation when in Flex Bus.CXL mode. This bit is reserved on CXL1.1 components. This bit should always be set to 1'b0 for CXL2.0 host Downstream ports. Default value of this field is 0. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_MLD_ENABLE Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
5	CXL2P0_ENABLE	* Varies	When set, enable CXL2.0 protocol operation when in Flex Bus.CXL mode. This bit is reserved on CXL1.1 components. Default value of this field is 0. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_CXL2P0_ENABLE Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
4	DRIFT_BUF_EN	* Varies	DRIFT BUFFER ENABLE. When set, enables drift buffer (instead of elastic buffer) if there is a common reference clock. When SerDes Architecture is not enabled (CX_PIPE_SERDES_ARCH = 0), don't set 1 in this field. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_DRIFT_BUFFER_ENABLE Exists: (CX_CXL_ENABLE&& (CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
3	CXL_SYNC_HDR_BYPASS_EN	* Varies	CXL SYNCHRONOUS HEADER BYPASS ENABLE. When set, enables bypass of the 2-bit sync header by the Flex Bus physical layer when operating in Flex Bus.AL mode. This is a performance optimization. When SerDes Architecture is not enabled (CX_PIPE_SERDES_ARCH = 0), don't set 1 in this field. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_SYNC_HDR_BYPASS_ENABLE Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: writeAsRead Volatile: true
2	MEM_EN	* Varies	MEMORY ENABLE. When set, enables CXL.mem protocol operation when in Flex Bus.AL mode. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_MEM_ENABLE Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
1	IO_EN	* Varies	IO ENABLE. When set, enables CXL.io protocol operation when in Flex Bus.AL mode. (Must always be set to 1). The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_CXL_IO_ENABLE Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead
0	CACHE_EN	* Varies	CACHE ENABLE. When set, enables CXL.cache protocol operation when in Flex Bus.AL mode. The Flex Bus physical layer samples the value in this register only during exit from the Detect LTSSM state and ignores any changes to this register in all other LTSSM states. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1 && MEMORY_MAP_POSITION == 0) then R/W(sticky) else R(sticky) Value After Reset: DEFAULT_CXL_PORT_USP_CACHE_ENABLE Exists: (CX_CXL_ENABLE&&(CX_MEMORY_MAP_PCIE_TYPE<2)) Testable: wire ? unconstrained : writeAsRead

31:20	CXL_DEVICE_NEXT_OFFSET	* Varies	CXL DEVICE NEXT OFFSET. This Device next offset field has read-write attribute and sticky reset type for the offset value 00h with [31:20] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CXL_DEVICE_CAP_VERSION	* Varies	CXL DEVICE CAPABILITY VERSION. This Device Capability version field has read-write attribute and sticky reset type for the offset value 00h with [19:16] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
15:0	CXL_DEVICE_CAP_ID	* Varies	CXL Device Capability ID. This Device Capability ID field has read-write attribute and sticky reset type for the offset value 00h with [15:0] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x23 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.44.2 CXL_RCIEP_DVSEC_HDR_1_OFF

- **Name:** DVSEC Vendor ID, DVSEC Revision, DVSEC Length.
- **Description:** This register is for Designated Vendor Specific Header 1 with offset 04H.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

31:20	DVSEC_LEN
19:16	DVSEC_REV
15:0	DVSEC_VNDR_ID

Table 3-304 Fields for Register: CXL_RCIEP_DVSEC_HDR_1_OFF

Bits	Name	Memory Access	Description
31:20	DVSEC_LEN	* Varies	DVSEC Length. The DVSEC Legth field is set to 16 bytes to accomodate the Flex Bus registers included in the DVSEC. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x38 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	DVSEC_REV	* Varies	DVSEC Revision. the DVSEC revision field is set to 0x0 to show that this is an FLex Bus feature specific header capability structure. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
15:0	DVSEC_VNDR_ID	* Varies	DVSEC vendor ID. This DVSEC Vendor ID has read-write attribute and sticky reset type for the offset value as 04h with [15:0] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1e98 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.44.3 CXL_RCIEP_DVSEC_HDR_2_FLEXBUS_CAP_OFF

- **Name:** DVSEC ID,cache Capable, IO capable, Memory capable, Memory HwInit Mode, HDM count and Viral capable.
- **Description:** This register is for Designated vendor specific Header 2 with offset 08H.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

Table 3-305 Fields for Register: CXL_RCIEP_DVSEC_HDR_2_FLEXBUS_CAP_OFF

Bits	Name	Memory Access	Description
31	PM_INIT_CMPL_RPT_CAP	* Varies	Power Management complete Report Capable. If set, indicates that the CXL device shall is capable of supporting Power Management Initialization Complete flag. All CXL 2.0 devices shall set this capability bit. CXL 1.1 devices may implement this capability. This capability is not applicable to switches and Root Ports. Switches and Root Ports shall hardwire this bit to 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_PM_INIT_CMPL_RPT_EN} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
30	VIRAL_CAP	* Varies	VIRAL CAPABLE. If set, indicates CXL device supports Viral handling. This value must be the same for all functions of an MLD. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_VIRAL_CAPABLE} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
29	CXL_LOGICAL_DEV	* Varies	Logical Device. If set, indicates this is a Logical Device. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_LOGICAL_DEVICE_EN} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
28	RSVDP_28	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
27	CXL_RST_MEM_CLR_CAP	* Varies	CXL Reset Mem Clr Capable. When set, Device is capable of clearing or randomizing of Volatile HDM Ranges during CLX FLR. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_RESET_MEM_CLR_EN} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
26:24	CXL_RST_TIMEOUT	* Varies	CXL Reset Timeout. If CXL Reset Capable bit is set, this field indicates the maximum time that the device may take to complete the CXL Reset in. If CXL Reset Mem Clr Capable bit is 1, this time also accounts for the time needed for clearing or randomizing of volatile HDM Ranges. If CXL Reset completion status bit in Flex Bus Status2 register is not set after the passage of this time duration, software may assume CXL Reset has failed. This value must be the same for all functions of an MLD. All other encodings are Reserved. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (encoding_for_ten_ms): 10 ms ■ 0x1 (encoding_for_hundred_ms): 100 ms ■ 0x2 (encoding_for_one_s): 1 s ■ 0x3 (encoding_for_ten_s): 10 s ■ 0x4 (encoding_for_hundred_s): 100 s Value After Reset: "(CX_CXL_RESET_EN) ? CX_CXL_RESET_TIMEOUT : 0" Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
23	CXL_RST_CAP	* Varies	CXL Reset Capable. If set, indicates the device supports CXL Reset and implements the CXL Reset Timeout field in this register, Initiate CXL Reset bit in Flex Bus Control2 register and CXL Reset Completion Status in Flex Bus Status2 register. This field must report the same value for all functions of an MLD. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_RESET_EN} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
22	CACHE_WB_INVALID_CAP	* Varies	Cache Writeback and Invalidation Cache. If set, indicates the device implements Disable Caching and Initiate Cache Write Back and Invalidation control bits in Flex Bus Control2 register and Cache Invalid status bit in Flex Bus Status2 register. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_CACHE_WR_INVLD_EN} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
21:20	HDM_COUNT	* Varies	HDM COUNT. Number of HDM ranges implemented by the CXL device and reported through this function. 00 - Zero ranges. This setting is illegal if CXL.mem Capable=1. 01 - One HDM range. 10 - Two HDM ranges. 11 - Reserved. This field must return 00 if CXL.mem Capable=0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_HDM_COUNT} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
19	MEM_HWINIT_MODE	* Varies	MEMORY HWINIT MODE. If set, indicates this CXL.mem capable device initializes memory with assistance from hardware and firmware located on the device. If clear, indicates memory is initialized by host software such as device driver. This bit should be ignored if CXL.mem Capable=0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: {CX_CXL_MEM_HWINIT_MODE} Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
18	MEM_CAP	* Varies	MEMORY CAPABLE. If set, indicates CXL.mem protocol support when operating in Flex Bus.CXL mode. This must be 1 for all functions of an MLD. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: "(CX_CXL_MEM_EN) ? 1 : 0" Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
17	IO_CAP	R	IO CAPABLE. If set indicates CXL.io protocol support when operating in Flex Bus.CXL mode. Must be 1. <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
16	CACHE_CAP	* Varies	CACHE CAPABLE. If set, indicates CXL.cache protocol support when operating in Flex Bus.CXL mode. This must be 0 for all functions of an MLD. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: "(CX_CXL_CACHE_EN) ? 1 : 0" Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
15:0	DVSEC_ID	* Varies	DVSEC ID. DVSEC ID is set to 0x0 to advertise that this is an Flex Bus feature capability structure. it's offset value is at 04h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.44.4 CXL_RCIEP_FLEXBUS_CNTRL_STATUS_OFF

- **Name:** Cache Enable, IO Enable, Memory Enable, Cache SF Coverage, Cache SF Granularity, Cache Clean and Viral Enable, Viral Status.
- **Description:** This register controls DVSEC Flex Bus at offset 0CH.
- **Size:** 32 bits
- **Offset:** B+0xc
- **Exists:** (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
31	RSVDP_31	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
30	VIRAL_STATUS	R/W1C	VIRAL STATUS. When set, indicates that the CXL device has entered Viral self-isolation mode. Note- Viral condition is cleared by warm reset or cold reset, but Viral_Status bit survives warm reset. Note: Device shall exit Vviral condition upon hot reset, warm reset or cold reset even though this status bit is sticky. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
29:15	RSVDP_15	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
14	VIRAL_EN	* Varies	VIRAL ENABEL. When set, enables Viral handling in the CXL device. Locked by CONFIG_LOCK. Default value of this bit is 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-write\""

Bits	Name	Memory Access	Description
11	CACHE_CLEAN	* Varies	CACHE CLEAN EVICTION. Eviction: Performance hint to the device. Locked by CONFIG_LOCK. Default value of this bit is 0 <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Values: ■ 0x0 (Clean_eviction_from_DEV): Indicates clean evictions from device caches are needed for best performance ■ 0x1 (Clean_evic_not_required): Indicates clean evictions from device caches are NOT needed for best performance Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-write\""

Bits	Name	Memory Access	Description
10:8	CACHE_SF_GRAN	* Varies	CACHE SF Granularity. Performance hint to the device. Locked by CONFIG_LOCK. Default value of this field is 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Values: ■ 0x0 (Granular_Tracking_64B): Indicates 64B granular tracking on the Host ■ 0x1 (Granular_Tracking_128B): Indicates 128B granular tracking on the Host ■ 0x2 (Granular_Tracking_256B): Indicates 256B granular tracking on the Host ■ 0x3 (Granular_Tracking_512B): Indicates 512B granular tracking on the Host ■ 0x4 (Granular_Tracking_1KB): Indicates 1KB granular tracking on the Host ■ 0x5 (Granular_Tracking_2KB): Indicates 2KB granular tracking on the Host ■ 0x6 (Granular_Tracking_4KB): Indicates 4KB granular tracking on the Host ■ 0x7 (Granular_Tracking): Reserved Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \\"read-write\\" : (CX_MEMORY_MAP_VIEW==1) ? \\"read-write\\" : \\"read-write\\""

Bits	Name	Memory Access	Description
7:3	CACHE_SF_COV	* Varies	CACHE SF COVERAGE. Performance hint to the device. Locked by CONFIG_LOCK. For all other values it Indicates Snoop Filter coverage on the Host of $2^{(N+15d)}$ Bytes. For example, if this field contains the value 5, it indicates snoop filter coverage of 1MB. Default value of this field is 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Values: ■ 0x0 (Filter_cov): Indicates no Snoop Filter coverage on the Host Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \\"read-write\\" : (CX_MEMORY_MAP_VIEW==1) ? \\"read-write\\" : \\"read-write\\""
2	MEM_EN	* Varies	MEMORY ENABLE. When set, enables CXL.mem protocol operation when in Flex Bus.CXL mode. Locked by CONFIG_LOCK. Default value of this bit is 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \\"read-write\\" : (CX_MEMORY_MAP_VIEW==1) ? \\"read-write\\" : \\"read-write\\""

Bits	Name	Memory Access	Description
1	IO_EN	* Varies	IO ENABLE. When set, enables CXL.io protocol operation when in Flex Bus.CXL mode. This bit always returns 1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_CXL_IO_ENABLE Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
0	CACHE_EN	* Varies	CACHE_ENABLE. When set, enables CXL.cache protocol operation when in Flex Bus.CXL mode. Locked by CONFIG_LOCK. Default value of this bit is 0. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RWL ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-write\""

3.44.5 CXL_RCIEP_FLEXBUS_CNTRL_2_STATUS_2_OFF

- **Name:** Disable Caching, Initiate Cache Write Back and Invalidation, Initiate eFLR, Cache Invalid, eFLR Complete, Power Management Initialization Complete.
- **Description:** This register controls DVSEC Flex Bus at offset 10H.
- **Size:** 32 bits
- **Offset:** B+0x10
- **Exists:** (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

Table 3-307 Fields for Register: CXL_RCIEP_FLEXBUS_CNTRL_2_STATUS_2_OFF

Bits	Name	Memory Access	Description
31	PWR_INIT_CMPL	R	Power Management Initialization Complete. When set, it indicates that the device has successfully completed Power Management Initialization Flow and is ready to process various Power Management messages.If this bit is not set within 100 ms of link-up, software may conclude that the Power Management initialization has failed and may issue Secondary Bus Reset to force link reinitialization and Power Management re-initialization. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
30:19	RSVDP_19	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
18	CXL_RST_ERROR	R	CXL Reset Error. When set, device has completed CXL Reset with errors. Additional information will be available in error logs. Host software of Fabric Manager may optionally re-issue CXL Reset. Device shall clear this bit upon transition of Initiate CXL Reset bit from 0 to 1, prior to initiating CXL Reset flow. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
17	CXL_RST_CMPL	R	CXL Reset complete. When set, device has been successfully completed CXL Reset as defined in section Section 9.8. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
16	CACHE_INVALID	R	When set, device guarantees that it does not hold any valid lines and Disable Caching=1. This bit shall read as 0 when Disable Caching=0. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
15:4	RSVDP_4	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))
3	CXL_RST_MEM_CLR_EN	R/W	CXL Reset Mem Clr Enable. When set, and CXL Reset Mem Clr Capable returns 1, Device shall clear or randomize Volatile HDM ranges as part of the CXL Reset operation. When CXL Reset Mem Clr Capable is clear, this bit is ignored and Volatile HDM ranges may or may not be cleared or randomized during CXL Reset. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
2	INIT_CXL_RST	R/W	Initiate CXL Reset. When set to 1, device shall initiate CXL FLR as defined in Section 9.8. This bit always returns the value of 0 when read by the software. A write of 0 is ignored. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
1	INIT_CACHE_WR_INVALID	R/W	When set to 1, device shall write back all modified lines in the local cache and invalidate all lines. The device shall send CacheFlushed message to host as required by CXL.Cache protocol to indicate it does not hold any modified lines. If this bit is set when Disable Caching=0, the device behavior is undefined. This bit always returns the value of 0 when read by the software. A write of 0 is ignored. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true
0	DISABLE_CACHE	R/W	When set to 1, device shall no longer cache new modified lines in its local cache. Device shall continue to correctly respond to CXL.cache transactions. Default value of this bit is 0. Value After Reset: 0x0 Exists: (CX_CXL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: writeAsRead Volatile: true

3.44.6 CXL_RCIEP_FLEX_BUS_LOCK_OFF

- **Name:** Config Lock.
- **Description:** This register is for Flex Bus Lock.

Bits	Name	Memory Access	Description
12:8	DESIRED_INTERLEAVE_R1	* Varies	DESIRED INTERLEAVE - RANGE R1. If a CXL.mem capable CXL 1.1 device is connected to a single CPU via multiple Flex BusCXL links, this field represents the memory interleaving desired by the device. BIOS will configure the CPU to interleave accesses to this HDM range across links at this granularity. or the closest possible value supported by the host. In the case of CXL 2.0 device, this field represents the minimum desired interleave granularity for optimal device performance. Software should program the Interleave Granularity (IG) field in the HDM Decoder 0/n Control Registers (Section 8.2.5.12.7 and Section 8.2.5.12.15) to be an exact match or any larger granularity advertised by the device via CXL HDM Decoder Capability Register (Section 8.2.5.12.1). This field is treated as a hint. The device shall function correctly if the actual programmed value programmed in Interleave Granularity (IG) field in the HDM Decoder 0/n Control Registers is less than what is reported via this field. 00000 - No Interleave 00001 - 256 Byte Granularity 00010 - 4K Interleave The above encodings are backwards compatible with CXL 1.1. The following encodings are new for CXL 2.0 all other settings are reserved. Notes: If a CXL 2.0 Device has different desired interleave values for DPA ranges covered by this CXL Range 1, it should report a value that best fits the requirements for all such ranges (e.g. max of the values). If CXL 2.0 devices in an Interleave Set advertise different values for this field, Software may choose the smallest value that best fits the set. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky)

Bits	Name	Memory Access	Description
31:20	CXL_DEVICE_TEST_CAP_NEXT_OFFSET	* Varies	DVSEC DEVICE TEST Next Capability Offset. This field contains the offset to the next PCI Express DVSEC DEVICE TEST Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
19:16	CXL_DEVICE_TEST_CAP_VER	* Varies	PCI Express Extended capability Version for DEVICE TEST. This field is a PCIe DVSEC CXL DEVICE TEST defined version number that indicates the version of the capability structure present. This field is depends on the version of specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
15:0	CXL_DEVICE_TEST_CAP_ID	* Varies	PCI Express Extended Capability ID for DVSEC DEVICE TEST. This PCIe DVSEC DEVICE TEST defined ID number that indicates the nature and format of the extended capability. And this Device Test Capability ID field has read-write attribute and sticky reset type for the offset value 00h with [15:0] bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x23 Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.45.2 CXL_TEST_DVSEC_HDR_1_OFF

- **Name:** DVSEC Device TEST Header 1: Vendor ID, Revision, Length.
- **Description:** Register Fields for DVSEC DEVICE TEST Registers: Designated Vendor Specific Header 1.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

15:0	CXL_DEVICE_TEST_CAP_VND_ID

Table 3-318 Fields for Register: CXL_TEST_DVSEC_HDR_1_OFF

Bits	Name	Memory Access	Description
31:20	CXL_DEVICE_TEST_CAP_LENGTH	* Varies	DVSEC CXL DEVICE TEST HEADER 1 Length. The DVSEC Legth field is set to 16 bytes to accomodate the DEVIVCE TEST registers included in the DVSEC. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1c Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CXL_DEVICE_TEST_CAP_REV	* Varies	DVSEC CXL DEVICE TEST HEADER 1 REVISION. the DVSEC revision field is set to 0x0 to show that this is an DVSEC DEVICE TEST fetaure specific header capability structure. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead
15:0	CXL_DEVICE_TEST_CAP_VND_ID	* Varies	PCI Express Extended Capability vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1e98 Exists: (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==2)) Testable: wire ? unconstrained : writeAsRead

3.45.3 CXL_TEST_DVSEC_HDR_2_TEST_LOCK_OFF

- **Name:** DVSEC DEVICE TEST ID and TEST LOCK Capability.
- **Description:** this register field consists DVSEC ID for DEVICE TEST and Test Lock register field.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** (CX_CXL_DEVICE_CTS_EN && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==2))

Bits	Name	Memory Access	Description
31:20	RESBAR_CAP_NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xfff (MAX_VAL): Max value Value After Reset: Pointer value calculated at configuration time. Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead
19:16	RESBAR_CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This bit depends on the version of the specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xf (MAX_VAL): Max value Value After Reset: 0x1 Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
15:0	RESBAR_EXT_CAP_ID	* Varies	Resizable BAR Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Resizable BAR Capability is 0015h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Min value ■ 0xffff (MAX_VAL): Max value Value After Reset: 0x15 Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

3.46.2 RESBAR_CAP_REG_0_REG

- **Name:** Resizable BAR0 Capability Register.
- **Description:** The Resizable BAR0 Extended Capability indicates that how much BAR size Function can support.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** ((CX_NUM_RBARS_\$pf>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0)) && CX_BAR0_RESIZABLE_\$pf

Values: ■ 0x1 (SET): If Set, function supports operating with BAR sized to 256 TB. Value After Reset: CX_BAR0_RESOURCE_AVAIL_n[32] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

Bits	Name	Memory Access	Description
15:14	RSVDP_14	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
13:8	RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR0 Size. The default value of this field is equal to the default size of the address space that the BAR0 resource is requesting through the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (MIN_VAL): 1MB(2²⁰ bytes) ■ 0x2b (MAX_VAL): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::resbar_size 0 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""
7:5	RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR0 Control register (0) (at offset 008h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable BAR for the function ■ 0x2 (BAR2): two resizable BARs for the function. ■ 0x3 (BAR3): three resizable BARs for the function. ■ 0x4 (BAR4): four resizable BARs for the function. ■ 0x5 (BAR5): five resizable BARs for the function. ■ 0x6 (BAR6): six resizable BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 0 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

4:3	RSVDP_3	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
2:0	RESBAR_CTRL_REG_IDX_0	R	BAR Index. This encoded value points to the beginning of the BAR0. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR_10h): BAR located at offset 10h. ■ 0x1 (BAR_14h): BAR located at offset 14h. ■ 0x2 (BAR_18h): BAR located at offset 18h. ■ 0x3 (BAR_1Ch): BAR located at offset 1Ch. ■ 0x4 (BAR_20h): BAR located at offset 20h. ■ 0x5 (BAR_24h): BAR located at offset 24h. Value After Reset: [::DWC_pcie_ctl::resbar_index 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.46.9 RESBAR_CTRL_REG_1_REG

- **Name:** Resizable BAR1 Control Register.
- **Description:** This register provides information about how much BAR1 size supported as well as BAR1 index and Number of BAR1.
- **Size:** 32 bits

13:8	RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR1 Size. The default value of this field is equal to the default size of the address space that the BAR1 resource is requesting through the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (MIN_VAL): 1MB(2²⁰ bytes) ■ 0x2b (MAX_VAL): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::resbar_size 1 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""
7:5	RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR1 Control register (0) (at offset 008h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable BAR for the function ■ 0x2 (BAR2): two resizable BARs for the function. ■ 0x3 (BAR3): three resizable BARs for the function. ■ 0x4 (BAR4): four resizable BARs for the function. ■ 0x5 (BAR5): five resizable BARs for the function. ■ 0x6 (BAR6): six resizable BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 1 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

2:0	RESBAR_CTRL_REG_IDX_1	R	BAR Index. This encoded value points to the beginning of the BAR1. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR_10h): BAR located at offset 10h. ■ 0x1 (BAR_14h): BAR located at offset 14h. ■ 0x2 (BAR_18h): BAR located at offset 18h. ■ 0x3 (BAR_1Ch): BAR located at offset 1Ch. ■ 0x4 (BAR_20h): BAR located at offset 20h. ■ 0x5 (BAR_24h): BAR located at offset 24h. Value After Reset: [::DWC_pcie_ctl::resbar_index 1] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

13:8	RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR2 Size. The default value of this field is equal to the default size of the address space that the BAR2 resource is requesting through the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (MIN_VAL): 1MB(2²⁰ bytes) ■ 0x2b (MAX_VAL): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::resbar_size 2 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""
7:5	RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR2 Control register (0) (at offset 008h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable BAR for the function ■ 0x2 (BAR2): two resizable BARs for the function. ■ 0x3 (BAR3): three resizable BARs for the function. ■ 0x4 (BAR4): four resizable BARs for the function. ■ 0x5 (BAR5): five resizable BARs for the function. ■ 0x6 (BAR6): six resizable BARs for the function. 2:0	RESBAR_CTRL_REG_IDX_2	R	BAR Index. This encoded value points to the beginning of the BAR2. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR_10h): BAR located at offset 10h. ■ 0x1 (BAR_14h): BAR located at offset 14h. ■ 0x2 (BAR_18h): BAR located at offset 18h. ■ 0x3 (BAR_1Ch): BAR located at offset 1Ch. ■ 0x4 (BAR_20h): BAR located at offset 20h. ■ 0x5 (BAR_24h): BAR located at offset 24h. 13:8	RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR5 Size. The default value of this field is equal to the default size of the address space that the BAR5 resource is requesting through the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (MIN_VAL): 1MB(2²⁰ bytes) ■ 0x2b (MAX_VAL): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::resbar_size 5 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""
7:5	RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR5 Control register (0) (at offset 008h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable BAR for the function ■ 0x2 (BAR2): two resizable BARs for the function. ■ 0x3 (BAR3): three resizable BARs for the function. ■ 0x4 (BAR4): four resizable BARs for the function. ■ 0x5 (BAR5): five resizable BARs for the function. ■ 0x6 (BAR6): six resizable BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 5 0] Exists: ((CX_NUM_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

2:0	RESBAR_CTRL_REG_IDX_5	R	BAR Index. This encoded value points to the beginning of the BAR5. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR_10h): BAR located at offset 10h. ■ 0x1 (BAR_14h): BAR located at offset 14h. ■ 0x2 (BAR_18h): BAR located at offset 18h. ■ 0x3 (BAR_1Ch): BAR located at offset 1Ch. ■ 0x4 (BAR_20h): BAR located at offset 20h. ■ 0x5 (BAR_24h): BAR located at offset 24h. 3.47 PF_VF_RESBAR_CAPi Registers

3.47.1 VF_RESBAR_CAP_HDR_REG

- **Name:** Resizable BAR Capability Header.
- **Description:** VF Resizable Extended Capability Header provides information about Capability ID, Version, and Next offset.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** ((CX_NUM_VF_RBARS_\$pf>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_NUM_VF_RBARS_\$pf>0)

Bits	Name	Memory Access	Description
31:20	VF_RESBAR_CAP_NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of capabilities. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	VF_RESBAR_CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This bit depends on the version of the specification. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Table 3-339 Fields for Register: VF_RESBAR_CAP_REG_1_REG

Bits	Name	Memory Access	Description
31	VF_RESBAR_CAP_REG_1_128TB	* Varies	Up to 128TB BAR Supported. When Set, indicates that the Physical Function(PF) supports operating with the VF BAR1 sized to 128 TB. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SET): If Set, function supports operating with VF BAR sized to 128 TB. Value After Reset: VF_BAR1_RESOURCE_AVAIL_n[31] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""
30	VF_RESBAR_CAP_REG_1_64TB	* Varies	Up to 64TB BAR Supported. When Set, indicates that the Physical Function(PF) supports operating with the VF BAR1 sized to 64 TB. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SET): If Set, function supports operating with VF BAR sized to 64 TB. Value After Reset: VF_BAR1_RESOURCE_AVAIL_n[30] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

13:8	VF_RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR0 Size. This is an encoded value. ... The default value of this field is equal to the default size of the address space that the VF BAR0 resource is requesting through the VF BAR's read-only bits. When this register field is programmed, the value is immediately reflected in the size of the resource, as encoded in the number of read-only bits in the VF BAR. Software must only write values that correspond to those indicated as supported in the VF Resizable BAR Capability and Control registers. Writing an unsupported value will produce undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (_1MB): 1MB(2²⁰ bytes) ■ 0x1 (_2MB): 2MB(2²¹ bytes) ■ 0x2 (_4MB): 4MB(2²² bytes) ■ 0x3 (_8MB): 8MB(2²³ bytes) ■ 0x2b (_8EB): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::vf_resbar_size 0 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

7:5	VF_RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable VF BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in VF Resizable BAR0 Control register (0) (at offset 08h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable VF BAR for the function ■ 0x2 (BAR2): two resizable VF BARs for the function. ■ 0x3 (BAR3): three resizable VF BARs for the function. ■ 0x4 (BAR4): four resizable VF BARs for the function. ■ 0x5 (BAR5): five resizable VF BARs for the function. ■ 0x6 (BAR6): six resizable VF BARs for the function. Value After Reset: CX_NUM_VF_RBARS_0 Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
4:3	RSVDP_3	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
2:0	VF_RESBAR_CTRL_REG_IDX_0	R	BAR Index. This encoded value points to the beginning of the VF BAR0. For a 64-bit Base Address register, the VF BAR Index indicates the lower DWORD. This value indicates which VF BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (VF_BAR_24h): VF BAR located at offset 24h. ■ 0x1 (VF_BAR_28h): VF BAR located at offset 28h. ■ 0x2 (VF_BAR_2Ch): VF BAR located at offset 2Ch. ■ 0x3 (VF_BAR_30h): VF BAR located at offset 30h. ■ 0x4 (VF_BAR_34h): VF BAR located at offset 34h. ■ 0x5 (VF_BAR_38h): VF BAR located at offset 38h. Value After Reset: "0" Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

13:8	VF_RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR1 Size. This is an encoded value. ... The default value of this field is equal to the default size of the address space that the VF BAR1 resource is requesting through the VF BAR's read-only bits. When this register field is programmed, the value is immediately reflected in the size of the resource, as encoded in the number of read-only bits in the VF BAR. Software must only write values that correspond to those indicated as supported in the VF Resizable BAR Capability and Control registers. Writing an unsupported value will produce undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (_1MB): 1MB(2²⁰ bytes) ■ 0x1 (_2MB): 2MB(2²¹ bytes) ■ 0x2 (_4MB): 4MB(2²² bytes) ■ 0x3 (_8MB): 8MB(2²³ bytes) ■ 0x2b (_8EB): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::vf_resbar_size 1 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

7:5	VF_RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable VF BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in VF Resizable BAR1 Control register (0) (at offset 08h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable VF BAR for the function ■ 0x2 (BAR2): two resizable VF BARs for the function. ■ 0x3 (BAR3): three resizable VF BARs for the function. ■ 0x4 (BAR4): four resizable VF BARs for the function. ■ 0x5 (BAR5): five resizable VF BARs for the function. ■ 0x6 (BAR6): six resizable VF BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 1 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

2:0	VF_RESBAR_CTRL_REG_IDX_1	R	BAR Index. This encoded value points to the beginning of the VF BAR1. For a 64-bit Base Address register, the VF BAR Index indicates the lower DWORD. This value indicates which VF BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (VF_BAR_24h): VF BAR located at offset 24h. ■ 0x1 (VF_BAR_28h): VF BAR located at offset 28h. ■ 0x2 (VF_BAR_2Ch): VF BAR located at offset 2Ch. ■ 0x3 (VF_BAR_30h): VF BAR located at offset 30h. ■ 0x4 (VF_BAR_34h): VF BAR located at offset 34h. ■ 0x5 (VF_BAR_38h): VF BAR located at offset 38h. Value After Reset: "1" Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

13:8	VF_RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR2 Size. This is an encoded value. ... The default value of this field is equal to the default size of the address space that the VF BAR2 resource is requesting through the VF BAR's read-only bits. When this register field is programmed, the value is immediately reflected in the size of the resource, as encoded in the number of read-only bits in the VF BAR. Software must only write values that correspond to those indicated as supported in the VF Resizable BAR Capability and Control registers. Writing an unsupported value will produce undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (_1MB): 1MB(2²⁰ bytes) ■ 0x1 (_2MB): 2MB(2²¹ bytes) ■ 0x2 (_4MB): 4MB(2²² bytes) ■ 0x3 (_8MB): 8MB(2²³ bytes) ■ 0x2b (_8EB): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::vf_resbar_size 2 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

7:5	VF_RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable VF BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in VF Resizable BAR2 Control register (0) (at offset 08h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable VF BAR for the function ■ 0x2 (BAR2): two resizable VF BARs for the function. ■ 0x3 (BAR3): three resizable VF BARs for the function. ■ 0x4 (BAR4): four resizable VF BARs for the function. ■ 0x5 (BAR5): five resizable VF BARs for the function. ■ 0x6 (BAR6): six resizable VF BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 2 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

2:0	VF_RESBAR_CTRL_REG_IDX_2	R	BAR Index. This encoded value points to the beginning of the VF BAR2. For a 64-bit Base Address register, the VF BAR Index indicates the lower DWORD. This value indicates which VF BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (VF_BAR_24h): VF BAR located at offset 24h. ■ 0x1 (VF_BAR_28h): VF BAR located at offset 28h. ■ 0x2 (VF_BAR_2Ch): VF BAR located at offset 2Ch. ■ 0x3 (VF_BAR_30h): VF BAR located at offset 30h. ■ 0x4 (VF_BAR_34h): VF BAR located at offset 34h. ■ 0x5 (VF_BAR_38h): VF BAR located at offset 38h. Value After Reset: "2" Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

13:8	VF_RESBAR_CTRL_REG_BAR_SIZE	* Varies	BAR5 Size. This is an encoded value. ... The default value of this field is equal to the default size of the address space that the VF BAR5 resource is requesting through the VF BAR's read-only bits. When this register field is programmed, the value is immediately reflected in the size of the resource, as encoded in the number of read-only bits in the VF BAR. Software must only write values that correspond to those indicated as supported in the VF Resizable BAR Capability and Control registers. Writing an unsupported value will produce undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (_1MB): 1MB(2²⁰ bytes) ■ 0x1 (_2MB): 2MB(2²¹ bytes) ■ 0x2 (_4MB): 4MB(2²² bytes) ■ 0x3 (_8MB): 8MB(2²³ bytes) ■ 0x2b (_8EB): 8EB(2⁶³ bytes) Value After Reset: [::DWC_pcie_ctl::vf_resbar_size 5 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

Bits	Name	Memory Access	Description
7:5	VF_RESBAR_CTRL_REG_NUM_BARS	R	Number of Resizeable BARs. This field indicates the total number of resizable VF BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in VF Resizable BAR5 Control register (0) (at offset 08h), and is RsvdP for all others. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (BAR1): one resizable VF BAR for the function ■ 0x2 (BAR2): two resizable VF BARs for the function. ■ 0x3 (BAR3): three resizable VF BARs for the function. ■ 0x4 (BAR4): four resizable VF BARs for the function. ■ 0x5 (BAR5): five resizable VF BARs for the function. ■ 0x6 (BAR6): six resizable VF BARs for the function. Value After Reset: [::DWC_pcie_ctl::resbar_nbars 5 0] Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

2:0	VF_RESBAR_CTRL_REG_IDX_5	R	BAR Index. This encoded value points to the beginning of the VF BAR5. For a 64-bit Base Address register, the VF BAR Index indicates the lower DWORD. This value indicates which VF BAR supports a negotiable size. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (VF_BAR_24h): VF BAR located at offset 24h. ■ 0x1 (VF_BAR_28h): VF BAR located at offset 28h. ■ 0x2 (VF_BAR_2Ch): VF BAR located at offset 2Ch. ■ 0x3 (VF_BAR_30h): VF BAR located at offset 30h. ■ 0x4 (VF_BAR_34h): VF BAR located at offset 34h. ■ 0x5 (VF_BAR_38h): VF BAR located at offset 38h. Value After Reset: "5" Exists: ((CX_NUM_VF_RBARS_0>0) && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.48.1 **ACK_LATENCY_TIMER_OFF**

- **Name:** Ack Latency Timer and Replay Timer Register.
- **Description:** This register holds the ack latency timer limit and replay timer limit values.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Table 3-350 Fields for Register: ACK_LATENCY_TIMER_OFF

Bits	Name	Memory Access	Description
31:16	REPLAY_TIME_LIMIT	R/W	Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more information, see "Transmit Replay" in the <i>Databook</i>. - You can modify the effective timer limit through the <code>TIMER_MOD_REPLAY_TIMER</code> field of the <code>TIMER_CTRL_MAX_FUNC_NUM_OFF</code> register. - After reset, the controller updates the default according to the Negotiated Link Width, <code>Max_Payload_Size</code>, and speed. The value is determined from Tables 3-4, 3-5, and 3-6 of the <i>PCI Express Base Specification</i>. - If there is a change in the payload size or link speed, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the <code>TIMER_MOD_REPLAY_TIMER</code> field of the <code>TIMER_CTRL_MAX_FUNC_NUM_OFF</code> register. Value After Reset: {12429/CX_NB} Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: untestable Volatile: true
15:0	ROUND_TRIP_LATENCY_TIME_LIMIT	R/W	Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more information, see "ACK/NAK Scheduling" in the <i>Databook</i>. - You can modify the effective timer limit through the <code>TIMER_MOD_ACK_NAK</code> field of the <code>TIMER_CTRL_MAX_FUNC_NUM_OFF</code> register. - After reset, the controller updates the default according to the Negotiated Link Width, <code>Max_Payload_Size</code>, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the <i>PCI Express Base Specification</i>. - The limit must reflect the round trip latency from requester to completer. - If there is a change in the payload size or link width, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the <code>TIMER_MOD_ACK_NAK</code> field of the <code>TIMER_CTRL_MAX_FUNC_NUM_OFF</code> register. Value After Reset: {4143/CX_NB} Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: untestable Volatile: true

Bits	Name	Memory Access	Description
31:0	VENDOR_SPEC_DLLP	R/W	Vendor Specific DLLP Register. You can use this register to send a specific PCI Express DLLP. Your application can write 8-bit DLLP Type and 24-bit Payload data into this register, and set the VENDOR_SPECIFIC_DLLP_REQ field of the PORT_LINK_CTRL_OFF, to send the DLLP. ■ Bits[7:0]: DLLP Type ■ Bits[31:8]: Vendor Defined Payload (24 bits) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (ZERO): Zero value ■ 0xffffffff (MAX): Max value Value After Reset: 0xffffffff Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.48.3 PORT_FORCE_OFF

- **Name:** Port Force Link Register.
- **Description:** This register can be used for testing and debuggong the link.
- **Size:** 32 bits

Bits	Name	Memory Access	Description
31:24	RSVDP_24	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
23	DO_DESKEW_FOR_SRIS	R/W	Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, EIEOS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew instead of using received SKP OS or TS1 to TS2 transition if DO_DESKEW_FOR_SRIS is set to '1'. <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_DO_DESKEW_FOR_SRIS Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
22	SUPPORT_PART_LANES_RXEI_EXIT	R/W	Support LTSSM transition from Polling.Active to Polling.Config based on Rx 8 TSs on any lanes which are Rx EI exit too from base spec after 24ms timeout. This prevents some lanes detected but not Rx EI exit and LTSSM cannot move to Polling.Config. You must set the parameter CX_AUTO_LANE_FLIP_CTRL_EN true for the auto lanes reversal. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SUPPORT): Any lanes receives 8 consecutive TS OSs, LTSSM moves from Polling.Active to Polling.Config. If all lanes do not receive 8 consecutive TS OSs and any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. ■ 0x0 (UNSUPPORT): Any lanes receives 8 consecutive TS OS and all predetermined lanes have Rx ElecIdle exit, LTSSM moves from Polling.Active to Polling.Config. This is legacy mode from Base Spec. Any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. Value After Reset: DEFAULT_SUPPORT_PART_LANES_RXEI_EXIT_IN_POLL_ACTIVE Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
21:16	LINK_STATE	R/W	Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
15	FORCE_EN	W	Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: - Forces the LTSSM to the state specified by the Forced LTSSM State field. - Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a '0'. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

11:8	FORCED_LTSSM	R/W	Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
7:0	LINK_NUM	R/W	Link Number. Not used for endpoint. <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_LINK_NUM Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.48.4 ACK_F_ASPM_CTRL_OFF

- **Name:** Ack Frequency and L0-L1 ASPM Control Register.

Bits	Name	Memory Access	Description
23:16	COMMON_CLK_N_FTS	* Varies	Common Clock N_FTS. This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. This field is only writable (sticky) when all of the following configuration parameter equations are true: ■ <code>CX_NFTS != CX_COMM_NFTS</code> ■ <code>DEFAULT_L0S_EXIT_LATENCY != DEFAULT_COMM_L0S_EXIT_LATENCY</code> ■ <code>DEFAULT_L1_EXIT_LATENCY != DEFAULT_COMM_L1_EXIT_LATENCY</code> <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: R Values: ■ 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. ■ 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: <code>CX_COMM_NFTS</code> Exists: <code>(!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))</code> Memory Access: <code>"(CX_MEMORY_MAP_VIEW==0 && CX_COMM_CLK_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_COMM_CLK_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1 && CX_COMM_CLK_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !CX_COMM_CLK_EN) ? \"read-only\" : (CX_COMM_CLK_EN) ? \"read-write\" : \"read-only\""</code>

Bits	Name	Memory Access	Description
15:8	ACK_N_FTS	R/W	The number of Fast Training Sequence(N_FTS) ordered sets to be transmitted when transitioning from L0s to L0. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. ■ 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: CX_NFTS Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
7:0	ACK_FREQ	R/W	Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. ■ 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. ■ 1-255: Indicates that the controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting. For more information, see "ACK/NAK Scheduling" in the <i>Databook</i>. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): The value '0' indicates that this Ack Frequency Counter feature is turned off. ■ 0xff (MAX_VAL): Any value between 1 and 255 indicates that the controller will schedule a high-priority ACK after receiving the specified number of TLPs. Value After Reset: DEFAULT_ACK_FREQUENCY Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

31:16	MASK_RADM_1	R/W	Filter Mask 1. The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more information, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule. 31: CX_FLT_MASK_RC_CFG_DISCARD ■ 0x0: For RADM RC filter to not allow CFG transaction being received ■ 0x1: For RADM RC filter to allow CFG transaction being received 30: CX_FLT_MASK_RC_IO_DISCARD ■ 0x0: For RADM RC filter to not allow IO transaction being received ■ 0x1: For RADM RC filter to allow IO transaction being received 29: CX_FLT_MASK_MSG_DROP ■ 0x0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. ■ 0x1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII. ■ The default for this bit is the inverse of FLT_DROP_MSG. That is, if FLT_DROP_MSG =1, then the default of this bit is '0' (drop message TLPs). This bit only controls message TLPs other than Vendor MSGs. Vendor MSGs are controlled by Filter Mask Register 2, bits [1:0]. The controller never passes ATS Invalidate messages to the SII interface regardless of this filter rule setting. The controller passes all ATS Invalidate messages to TRGT1 (or AXI bridge master), as they are too big for the SII. 28: CX_FLT_MASK_CPL_ECRC_DISCARD ■ Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. ■ 0x0: Discard completions with ECRC errors

10:0	SKP_INT_VAL	R/W	SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. The controller waits the number of symbol times in this register plus 1, between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick =two symbol times in this case). <i>Note:</i> This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. <i>Note:</i> This register field is sticky. Table 3-373 Fields for Register: GEN2_CTRL_OFF

Bits	Name	Memory Access	Description
31	SUPPORT_MOD_TS	* Varies	Enable the controller to send the Modified TS OS if both sides of the link agree when the SUPPORT_MOD_TS register is set to 1. The default of this field is the CX_MOD_TS_FMT_SUPPORT_VALUE configuration parameter. If the port negotiates alternate protocols or passes a Training Set Message, the bit must be set to 1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): Enable Value After Reset: CX_MOD_TS_FMT_SUPPORT_VALUE Exists: CX_MODIFIED_TS_FORMAT_SUPPORT && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""
30	FORCE_LANE_FLIP	* Varies	Enable to force the LANE_UNDER_TEST physical lane flips to logical lane 0. All the other physical lanes are turned off. The LINK_CAPABLE register must be set to 1 and only x1 link can be formed if the FORCE_LANE_FLIP register is set to 1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): Enable Value After Reset: 0x0 Exists: CX_FORCE_LANE_FLIP_EN && CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
29	TX_MOD_CMPL_PATTERN_FOR_LOOPBACK	* Varies	Require Loopback slave to transmit Modified Compliance Pattern in Loopback.Active state at Gen5 rate. The default of this field is the CX_DEFAULT_GEN5_TX_MOD_CMPL_PATTERN_FOR_LOOPBACK configuration parameter <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): Writing '1' to this field through the DBI instructs the remote Loopback slave to send Modified Compliance Pattern in Gen5 loopback.Active. Value After Reset: CX_DEFAULT_GEN5_TX_MOD_CMPL_PATTERN_FOR_LOOPBACK Exists: CX_GEN5_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
28	EQ_FOR_LOOPBACK	* Varies	Perform EQ in Loopback in Gen5 rate. The default of this field is the CX_DEFAULT_GEN5_EQ_FOR_LOOPBACK configuration parameter. Loopback master enters Loopback.Active only because of receiving 2 TS1s with Loopback bit asserted (not the 2ms timeout of Txing Compliance Receive bit) if EQ_FOR_LOOPBACK is set to 1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): Writing '1' to this field through the DBI instructs the link to perform Eq in Gen5 loopback if both sides support Gen5 rate. Value After Reset: CX_DEFAULT_GEN5_EQ_FOR_LOOPBACK Exists: CX_GEN5_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""
27:24	LANE_UNDER_TEST	* Varies	The Lane Under Test is the lane for Forced Lane Flip or for Loopback Eq. Only one lane is configured each time. The default of this field is the CX_DEFAULT_LANE_UNDER_TEST configuration parameter. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Zero ■ 0x1 (MAX_VAL): CX_NL Value After Reset: CX_DEFAULT_LANE_UNDER_TEST Exists: CX_LANE_UNDER_TEST_EN && CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
23	SELECTABLE_DEEMPH_BIT_MUX	R/W	The selectable deemphasis bit (Symbol 4 bit 6) of the transmitted TS2 Ordered Sets for DSP in Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP. <i>Note:</i> This register field is sticky. Values: 0x0 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register 0x1 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP Value After Reset: DEFAULT_SELECTABLE_DEEMPH_BIT_MUX Exists: CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
22	SELECT_DEEMPH_VAR_MUX	R/W	The select_deemphasis variable for DSP on entry to Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by the Upstream Port in the eight consecutive TS1 Ordered Sets it received. <i>Note:</i> This register field is sticky. Values: 0x0 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP 0x1 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register Value After Reset: DEFAULT_SELECT_DEEMPH_VAR_MUX Exists: CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
21	GEN1_EI_INFERENCE	R/W	Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a '1' value on RxElecdle instead of looking for a '0' on RxValid. If the PHY fails to de-assert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (RXELECIDLE_TO_INFER): Use RxElecdle signal to infer Electrical Idle ■ 0x1 (RXVALID_TO_INFER): Use RxValid signal to infer Electrical Idle Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
20	SEL_DEEMPHASIS	* Varies	Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (N_6DB): -6 dB ■ 0x1 (N_3_5DB): -3.5 dB Value After Reset: SEL_DE_EMPHASIS Exists: CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : \"read-write\" "

Bits	Name	Memory Access	Description
19	CONFIG_TX_COMP_RX	* Varies	Config Tx Compliance Receive Bit. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SET): When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to '1'). ■ 0x0 (CLEAR): Clear Value After Reset: 0x0 Exists: CX_GEN2_SPEED CX_PCIE_OVER_CIO_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_PCIE_OVER_CIO_ENABLE) ? \"read-only\" : \"read-write\" "
18	CONFIG_PHY_TX_CHANGE	* Varies	Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (FULL_SWING): Full Swing ■ 0x1 (LOW_SWING): Low Swing Value After Reset: DEFAULT_GEN2_TXSWING Exists: CX_GEN2_SPEED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : \"read-write\" "

Bits	Name	Memory Access	Description
17	DIRECT_SPEED_CHANGE	* Varies	Directed Speed Change. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a '0'. To manually initiate the speed change: ■ Write to LINK_CONTROL2_LINK_STATUS2_REG.PCIE_CAP_TARGET_LINK_SPEED in the local device ■ De-assert this field ■ Assert this field If you set the default of this field using the DEFAULT_GEN2_SPEED_CHANGE configuration parameter to '1', then the speed change is initiated automatically after link up, and the controller clears the contents of this field. If you want to prevent this automatic speed change, then write a lower speed value to the Target Link Speed field of the Link Control 2 register (LINK_CONTROL2_LINK_STATUS2_OFF.PCIE_CAP_TARGET_LINK_SPEED) through the DBI before link up. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x1 (SET): Writing '1' to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed. ■ 0x0 (CLEAR): Clear Value After Reset: DEFAULT_GEN2_SPEED_CHANGE Exists: CX_GEN2_SPEED CX_PCIE_OVER_CIO_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true Memory Access: "(CX_PCIE_OVER_CIO_ENABLE) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
16	AUTO_LANE_FLIP_CTRL_EN	* Varies	Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller. For more information, see the 'Lane Reversal' appendix in the <i>Databook</i>. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: {(CX_AUTO_LANE_FLIP_CTRL_EN) ? "0x1" : "0x0"} Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: {(SNPS_RSVDPARAM_25) ? 15:13	PRE_DET_LANE	* Varies	Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. Values: ■ 0x0 (LANE0): Connect logical Lane0 to physical lane 0 or CX_NL-1 or CX_NL/2-1 or CX_NL/4-1 or CX_NL/8-1, depending on which lane is detected ■ 0x1 (LANE1): Connect logical Lane0 to physical lane 1 ■ 0x2 (LANE3): Connect logical Lane0 to physical lane 3 ■ 0x3 (LANE7): connect logical lane0 to physical lane 7 ■ 0x4 (LANE15): Connect logical Lane0 to physical lane 15 Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: {(SNPS_RSVDPARAM_25) ? Bits	Name	Memory Access	Description
12:8	NUM_OF_LANES	* Varies	Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken' or 'unused' lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the <i>PCI Express Base Specification</i>. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes" in the <i>Databook</i>. For information on upsizing and downsizing the link width, see "Link Establishment" in the <i>Databook</i>. Note: The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) Note: This register field is sticky. Values: ■ 0x1 (_1_LANE): 1 lane ■ 0x2 (_2_LANE): 2 lanes ■ 0x3 (_3_LANE): 3 lanes Value After Reset: CX_NL Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: {(SNPS_RSVDPARAM_25) ? 7:0	FAST_TRAINING_SEQ	* Varies	Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W (sticky) ■ Dbi: R/W (sticky) <i>Note:</i> This register field is sticky. 3.48.28 **CLOCK_GATING_CTRL_OFF**

- **Name:** Clock Gating Control Register.
- **Description:** This register enables you to disable dynamic clock gating. By default dynamic clock gating is on, allowing the controller to autonomously enable and disable its clocks. The clock gating is performed in the clock and reset module, `DWC_pcie_clk_rst.v`, and is initiated by the controllers clock enable signals. The following modules support dynamic clock gating:
 - AXI Bridge
 - RADM
- **Size:** 32 bits
- **Offset:** B+0x18c

1	AXI_CLK_GATING_EN	R/W	AXI Clock Gating Enable. This register enables the AXI Bridge to autonomously enable and disable the AXI Master clock, the AXI Slave clock and the AXI DBI slave clock. The DWC_pcie_clk_rst.v module provides the gated clock, mstr_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, mstr_aclk_active, is asserted. For the AXI Slave this module provides the gated clock, slv_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, slv_aclk_active, is asserted. If the AXI DBI Slave is enabled (DBI_4SLAVE_POPULATED=1) the module provides the gated clock, dbi_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, dbi_aclk_active, is asserted. The controller de-asserts the clock enable signals when the respective AXI Master/Slave interfaces are idle. <i>Note:</i> This register field is sticky. 0	RADM_CLK_GATING_EN	R/W	RADM Clock Gating Enable. This register, if set, enables the RADM to autonomously enable and disable its clock. The DWC_pcie_clk_rst.v module provides the gated clock, radm_clk_g, to the RADM and is enabled when the controllers clock enable signal, en_radm_clk_g, is asserted. The RADM clock is a gated version of the controller clock, core_clk. The controller de-asserts en_radm_clk_g when there is no Rx traffic, Rx queues and pre/post-queue pipelines are empty, RADM completion LUT is empty, and there are no FLR actions pending. <i>Note:</i> This register field is sticky. 3.48.29 GEN3_RELATED_OFF

- **Name:** Gen3 Control Register.
- **Description:** There is no Gen3-specific N_FTS field. The N_FTS field in the "Link Width and Speed Change Control Register" is used for both Gen2 and Gen3 speed modes. There is no Gen3-specific "Directed Speed Change" field. The "Directed Speed Change" field in the "Link Width and Speed Change Control Register" is used to change to Gen2 or Gen3 speed. A speed change to Gen3 occurs if (1) the "Directed Speed Change" field is set to '1' and (2) the "Target Link Speed" field in the Link Control 2 Register is set to Gen3. Gen3 support is advertised by both sides of the link during link training.

3.48.31 GEN3_EQ_PSET_COEF_MAP__i (for i = 0; i <= 10)

- **Name:** Gen3 EQ Presets to Coefficients Mapping Register.
- **Description:** This register is only used when you set the "Gen3 Equalization Presets to Coefficients Mapping Mod" to "Programmable Table", by setting the CX_GEN3_EQ_PSET_COEF_MAP_MODE configuration parameter to '2'. These registers are programmed through an indirect addressing scheme (using an index register) to reduce the address footprint in the PCI Express extended configuration space. The index register ("Gen3 EQ Preset Index Register") is used to select which Coefficients Mapping Register is being accessed. Therefore, only four bytes of the PCIe extended configuration space address map is used to contain 44 bytes of information. You must write to the index register ("Gen3 EQ Preset Index Register") before you write to this mapping register.
The controller does not automatically update the coefficients table when the "Gen3 EQ FS and LF Register" is updated with new values. Your application must re-program the controller with new coefficient values every time it updates FS and LF. Your application must ensure that the programmed coefficient values satisfy the "Rules for Transmitter Coefficients" defined in Section 4.2.3.1 of the *PCI Express Base Specification*. The controller does not apply the programmed coefficient values to mac_phy_txdeemph if they do not meet those rules.

0	GEN3_EQ_VIOLATE_COEF_RULES	R	Programmable Coefficients Legality Status. This bit is only valid after programming a coefficient into the mapping table. This bit is set if the most recently programmed coefficient ("Gen3 EQ Presets to Coefficients Mapping Registers" violate any of the following rules: ■ $\text{abs}(C-1) \leq (FS/4)$ ■ $\text{abs}(C-1) + C_0 + \text{abs}(C+1) = FS$ ■ $\text{abs}(C_0) - \text{abs}(C-1) - \text{abs}(C+1) \geq LF$ Your application should always check the status after it programs each coefficient, so that it then knows which preset number had the illegal coefficients. <i>Note:</i> You should ignore the value in this field until you have written/updated the programmable coefficients. Although the value of this register field is '0' during reset, it gets set to '1' almost immediately after the reset is removed. This is because the current coefficient defaults to '0', which is always illegal. So if this field is read before you program the coefficient mapping table, then it is '1'. This bit is automatically cleared when you read it. <i>Note:</i> This register field is sticky. 3.48.35 GEN3_EQ_FB_MODE_DIR_CHANGE_OFF

- **Name:** Gen3 EQ Direction Change Feedback Mode Control Register.
- **Description:** Equalization controls to be used in Phase2 (USP) or Phase 3 (DSP), when you set the Feedback Mode in "Gen3 EQ Control Register" to "Direction Change." These fields allow control over the initial starting point for the search of optimal coefficient settings, and allow control over the criteria used to determine when the optimal settings have been achieved. The values are applied to all the lanes.

3.48.41 TRGT_CPL_LUT_DELETE_ENTRY_OFF

- **Name:** TRGT_CPL_LUT Delete Entry Control register.
- **Description:** Using this register you can delete one entry in the target completion LUT. You should only use this register when you know that your application will never send the completion because of an FLR or any other reason.
Note:: The target completion LUT (and associated target completion timeout event) is watching for completions (from your application on XALI0/1/2 or AXI master read channel) corresponding to previously received non-posted requests from the PCIe wire.

Bits	Name	Memory Access	Description
0	AUTO_FLUSH_EN	R/W	Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: ■ Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. ■ Warm (Soft) reset request. Generated when exiting from D3 to D0 and <code>cfg_pm_no_soft_rst=0</code>. ■ Link down reset request. A high to low transition on <code>smlh_req_rst_not</code> indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. For more information see "Warm and Hot Resets" section in the Architecture chapter of the <i>Databook</i>. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (DISABLE): Disable ■ 0x1 (ENABLE): Enable Value After Reset: 0x1 Exists: (AMBA_INTERFACE>1) && CC_DEVICE_TYPE!=3 && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

15:10	AMBA_ERROR_RESPONSE_MAP	R/W	AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. ■ 0 □ 0x0: UR (unsupported request) -> DECERR □ 0x1: UR (unsupported request) -> SLVERR ■ 1 □ 0x0: CRS (configuration retry status) -> DECERR □ 0x1: CRS (configuration retry status) -> SLVERR ■ 2 □ 0x0: CA (completer abort) -> DECERR □ 0x1: CA (completer abort) -> SLVERR ■ 3: RESERVED (0x0) ■ 4: RESERVED (0x0) ■ 5 □ 0x0: Completion Timeout -> DECERR □ 0x1: Completion Timeout -> SLVERR. The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read databus to 0xFFFF for all error responses. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (Min_value): Zero value ■ 0x3f (Max_value): Max value Value After Reset: 0x27 Exists: (AMBA_INTERFACE>1) && CC_DEVICE_TYPE!=3 && AXI_POPULATED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

For more information see "Error Handling" in the AXI chapter of the <i>Databook</i>. The error response mapping is not applicable to Non-existent Vendor ID register reads. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (OK_): OKAY (with FFFF data for non-posted requests) ■ 0x1 (ERR_): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0 Exists: AMBA_INTERFACE!=0 && CC_DEVICE_TYPE!=3 && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

3.48.44 AMBA_LINK_TIMEOUT_OFF

- **Name:** Link Down AXI Bridge Slave Timeout Register.
- **Description:** If your application AXI master issues outbound requests to the AXI bridge slave interface before the PCIe link is operational, the controller starts a "flush" timer. The timeout value of the timer is set by this register. If the timer times out before the PCIe link is operational, the bridge TX request queues are flushed. For more information, see the "AXI Bridge Initialization, Clocking and Reset" section in the AXI chapter of the *Databook*.

Bits	Name	Memory Access	Description
4:3	AX_MSTR_ORDR_P_EVENT_SEL	R/W	AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels, you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. Note: This setting will not affect: ■ MSI interrupt catcher and P data ordering. This is always driven by the B'last event. ■ DMA read engine TLP ordering. This is always driven by the B'last event. ■ NP write transactions which are always serialized with P write transactions. Values: ■ 0x0 (B): B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). ■ 0x1 (AW): AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. ■ 0x2 (W): W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. ■ 0x3 (RSVD): Reserved Value After Reset: 0x0 Exists: (AMBA_INTERFACE >= 2) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE == 2 CX_MEMORY_MAP_PCIE_TYPE == 0))

3.48.50 AXI_MSTR_MSG_ADDR_LOW_OFF

- **Name:** Lower 32-bits of the Programmable AXI Address.
- **Description:** Lower 20 bits of the programmable AXI address to which Messages coming from wire are mapped. Bits [11:0] of the register are tied to zero for the address to be 4k-aligned. In previous releases, the third and fourth DWORDs of a message (Msg/MsgD) TLP header were delivered through the AXI master address bus (mstr_awaddr). These DWORDS are now supplied through the mstr_awmisc_info_hdr_34dw[63:0] output; and the value on mstr_awaddr is driven to the value you have programmed into the AXI_MSTR_MSG_ADDR_LOW_OFF and AXI_MSTR_MSG_ADDR_HIGH_OFF registers.

3.48.54 IATU_VIEWPORT_OFF

- **Name:** iATU Index Register.
- **Description:** The iATU registers are programmed through an indirect addressing scheme (using this index register) to reduce the address footprint in the PCI Express extended configuration space. The size of the required port logic space does not depend on the number of regions defined as the index register is used to select which memory region is being accessed. There are 28 bytes of register space implemented per address region per direction. The number of address regions that are remapped by the iATU is configurable in each direction from '0' (none) to 256. However, only 32 bytes of the PCIe extended configuration space address map is used.
Note: When register does not exist, value is fixed to 32'hFFFF_FFFF
- **Size:** 32 bits

Bits	Name	Memory Access	Description
22:20	CTRL_1_FUNC_NUM	R/W	Function Number. MEM-I/O: When the Address and BAR matching logic in the controller indicates that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. <i>Note:</i> This register field is sticky. Table 3-406 Fields for Register: IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
31	REGION_EN	R/W	Region Enable. This bit must be set to '1' for address translation to take place. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
30	RSVDP_30	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
29	INVERT_MODE	R/W	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
28	CFG_SHIFT_MODE	R/W	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
27	DMA_BYPASS	R/W	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. <i>Note:</i> This field is reserved for the SW product. You must set it to '0'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CC_DMA_ENABLE && CC_DEVICE_TYPE!=3 && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
23	HEADER_SUBSTITUTE_EN	R/W	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_VIEWPORT_OFF_OUTBOUND_i. <i>Note:</i> This register field is sticky. Values: 0x1 (FILL_BYTES): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_VIEWPORT_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. 0x0 (FORMS_ADDR): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_VIEWPORT_OFF_OUTBOUND_i register forms the new address of the translated region. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !ICC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
22	INHIBIT_PAYLOAD	R/W	Inhibit TLP Payload Data for TLPs in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. Encoding are define as above. <i>Note:</i> This register field is sticky. Values: 0x1 (TLP_NO_DATA): Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. 0x0 (TLP_WITH_OR_WITHOUT_DATA): Fmt[1] =0/1 so that TLPs with or without data can be sent. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !ICC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
21	TLP_HEADER_FIELDS_BYPASS	R/W	TLP Header Fields Translation Bypass. In this mode header fields of the translated TLP is taken from your application transmit interface, or if AMBA is configured, from the AMBA sideband bus (slv_awmisc_info) and not from the corresponding fields of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i or IATU_REGION_CTRL_2_OFF_OUTBOUND_i registers. The header fields are ■ TC ■ PH ■ TH ■ ST ■ AT ■ Attr (IDO, RO and NS) <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
20	SNP	R/W	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && AXI_POPULATED && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
19	FUNC_BYPASS	R/W	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Region Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
18:17	MSB2BITS_TAG	R/W	Not used. Reserved for future use. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CX_10BITS_TAG && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
16	TAG_SUBSTITUTE_EN	R/W	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. <i>Note (CX_TPH_ENABLE=1):</i> TAG substitution for MWr will not occur because this field (byte 6) in the TLP header is the ST field. ST substitution can still take place using the MSG_CODE field in IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i. <i>Note (CX_10BITS_TAG =1):</i> For 10-bit tags, TAG substitution only applies to the 8 least significant bits of the TAG field (bits 7:0 of Byte 4 of the TLP Header). T9 and T8 of the Header are not substituted. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead
15:8	TAG	R/W	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Bits	Name	Memory Access	Description
7:0	MSG_CODE	R/W	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST;Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead

Table 3-407 Fields for Register: IATU_REGION_CTRL_2_VIEWPORT_OFF_INBOUND_i (for i = 0; i <= CX_ATU_NUM_INBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
31	REGION_EN	R/W	Region Enable. This bit must be set to '1' for address translation to take place. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
30	MATCH_MODE	R/W	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM/IO TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. ■ 1: BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: ■ 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. ■ 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers.

Bits	Name	Memory Access	Description
30...(cont.)	MATCH_MODE.	R/W	1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN =1 AND MSG_TYPE_MATCH_MODE =1, then Match Mode is ignored. <i>Note:</i> This register field is sticky. Values: 0x0 (ZERO): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. 0x1 (ONE): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
29	INVERT_MODE	R/W	Invert Mode Enable. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). When set all regions of that type must use address match mode. <i>Note:</i> This register field is sticky. Values: 0x1 (ENABLE): Invert Mode Enable 0x0 (DISABLE): Invert Mode Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
28	CFG_SHIFT_MODE	R/W	CFG Shift Enable. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): CFG Shift Enable ■ 0x0 (DISABLE): CFG Shift Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
27	FUZZY_TYPE_MATCH_CODE	R/W	Fuzzy Type Match Enable. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that ■ CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. ■ MWr, MRd and MRdLk TLPs are seen as identical ■ The Routing field of Msg/MsgD TLPs is ignored ■ FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Region Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Fuzzy Type Match Enable ■ 0x0 (DISABLE): Fuzzy Type Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
26	VFBAR_MATCH_MODE_EN	R/W	VF BAR Match Enable. When set, Virtual Function BAR matching is used which allows all VFs in a PF which match a BAR to be matched with a single ATU region. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Virtual Function BAR Match Enable ■ 0x0 (DISABLE): Virtual Function BAR Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CX_SRIOV_ENABLE && CC_DEVICE_TYPE!=3 && CC_DEVICE_TYPE!=1 Testable: writeAsRead
25:24	RESPONSE_CODE	R/W	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NORMAL_RADM_FILTER): Normal RADM filter response is used. ■ 0x1 (UNSUPPORTED_REQUEST): Unsupported request (UR) ■ 0x2 (COMPLETER_ABORT): Completer abort (CA) ■ 0x3 (RESERVED): Not used / undefined / reserved. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
23	SINGLE_ADDR_LOC_TRANS_EN	R/W	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
22	PH_MATCH_EN	R/W	PH Match Enable. Ensures that a successful PH TLP field comparison match (see PH field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): PH Match Enable ■ 0x0 (DISABLE): PH Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CX_TPH_ENABLE Testable: writeAsRead

Bits	Name	Memory Access	Description
21	MSG_CODE_MATCH_EN	R/W	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Region Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPS). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Region Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is 1 <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Message Code Match Enable (for Msg TLPS) or ST Match Enable (for Mem TLPS) ■ 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
20	VF_MATCH_EN	R/W	Virtual Function Number Match Enable. Ensures that a successful Virtual Function Number TLP field comparison match (see Virtual Function Number field of the "iATU Control 3 Register") occurs (in MEM-I/O transactions) for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Virtual Function Number Match Enable ■ 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CX_SRIOV_ENABLE && CC_DEVICE_TYPE!=3 && CC_DEVICE_TYPE!=1 Testable: writeAsRead

Bits	Name	Memory Access	Description
19	FUNC_NUM_MATCH_EN	R/W	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Region Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Function Number Match Enable ■ 0x0 (DISABLE): Function Number Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
18	AT_MATCH_EN	R/W	AT Match Enable. Ensures that a successful AT TLP field comparison match (see AT field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only valid when the ATS_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): AT Match Enable ■ 0x0 (DISABLE): AT Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE && CC_DEVICE_TYPE!=3) Testable: writeAsRead

Bits	Name	Memory Access	Description
17	TH_MATCH_EN	R/W	TH Match Enable. Ensures that a successful TH TLP field comparison match (see TH field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: 0x1 (ENABLE): TH Match Enable 0x0 (DISABLE): TH Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) && CX_TPH_ENABLE Testable: writeAsRead
16	ATTR_MATCH_EN	R/W	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: 0x1 (ENABLE): ATTR Match Enable 0x0 (DISABLE): ATTR Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
15	TD_MATCH_EN	R/W	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: 0x1 (ENABLE): TD Match Enable 0x0 (DISABLE): TD Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
14	TC_MATCH_EN	R/W	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): TC Match Enable ■ 0x0 (DISABLE): TC Match Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
13	MSG_TYPE_MATCH_MODE	R/W	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the IATU_REGION_CTRL_1_VIEWPORT_OFF_INBOUND_i register (=>TYPE[4:3]=2'b10) is translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
12:11	RSVDP_11	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

Bits	Name	Memory Access	Description
10:8	BAR_NUM	R/W	BAR Number. When the BAR number of an inbound MEM or IO TLP "that is matched by the normal internal BAR address matching mechanism" is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Region Control 2 Register" is set. IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR0): BAR0 ■ 0x1 (BAR1): BAR1 ■ 0x2 (BAR2): BAR2 ■ 0x3 (BAR3): BAR3 ■ 0x4 (BAR4): BAR4 ■ 0x5 (BAR5): BAR5 ■ 0x6 (ROM): ROM ■ 0x7 (RSVD): Reserved Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead
7:0	MSG_CODE	R/W	MSG TLPs: (Message Code). When the MSG_CODE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Region Control 2 Register" is set and the TYPE field of the inbound TLP is Msg/MsgD. Memory TLPs: (ST:Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Control2 Register" is set. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) && (CX_INTERNAL_ATU_ENABLE && !CC_UNROLL_ENABLE) Testable: writeAsRead

3.48.59 IATU_LWR_BASE_ADDR_VIEWPORT_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Lower Base Address Register.
- **Description:** The CX_ATU_MIN_REGION_SIZE configuration parameter (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ bits are zero.
- **Size:** 32 bits
- **Offset:** B+0x20c
- **Exists:** (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
3:0	CBUF_INCR	* Varies	Circular Buffer Increment. When CX_ATU_SLOC_CBUF = 0, then this field is Read-only and forms the lowest bits of the end address of the address region to be translated. When CX_ATU_SLOC_CBUF = 1, then this field is R/W and forms the upper bits of the Circular Buffer Increment size (CBUF_INCR) field for Single Location Address translation. The increment value (in bytes) is decoded as follows: Note: A write to any bit in the CBUF_INCR field resets the circular buffer pointer - that is, the next matched received Message will be translated to the start address of the Circular Buffer. This field must be written to AFTER the target and limit registers have been updated. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R (sticky) <i>Note:</i> This register field is sticky. 3.48.65 IATU_LWR_TARGET_ADDR_VIEWPORT_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Lower Target Address Register.
- **Description:** This register holds the Lower Target part of the new address of the translated region, or the outbound TLP header information, depending on the setting of HEADER_SUBSTITUTE_EN field of IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i register.
- **Size:** 32 bits

Table 3-414 Fields for Register: IATU_LWR_TARGET_ADDR_VIEWPORT_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
31:0	LWR_TARGET_RW_OUTBOUND	R/W	When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i is '0' (normal operation): ■ LWR_TARGET_RW[31:n] forms MSBs of the Lower Target part of the new address of the translated region; ■ LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). ■ n is $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$. When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i is '1': ■ LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
x:0	LWR_TARGET_HW	R	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. - Field size depends on $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ in address match mode. - Field size depends on $\log_2(\text{BAR_MASK}+1)$ in BAR match mode. x:0	VF_NUMBER	R/W	Virtual Function Number. When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Region Control 2 Register" is '0', then this field used in generating the Function part of the requester ID (RID) field of the TLP. Indicates from which virtual function (VF) the request is mapped. The iATU uses this signal to form the requester ID. The PCIe SR-IOV specification starts numbering VFs at 1. To ease timing during synthesis, the PCIe controller starts numbering VFs at 0. For example, a value of '0' here refers to the first VF, of the PF that is identified by the CTRL_1_FUNC_NUM field in the "iATU Control 1 Register" For more information, see "RID BDF Number Replacement." 3.48.76 MSIX_ADDRESS_MATCH_LOW_OFF

- **Name:** MSI-X Address Match Low Register.
- **Description:** When you enable the MSI-X Table RAM feature (MSIX_TABLE_EN=1), the controller implements the logic and RAM required to generate MSI-X requests. For more information, see the Interrupts section in the "Controller Operations" chapter of the Databook. This register is only used in AXI configurations. When your local AXI application writes (MWr) to the address defined in this register (and MSIX_ADDRESS_MATCH_HIGH_OFF), the controller will load the MSIX_DOORBELL_OFF register with the contents of the MWr and subsequently create and send MSI-X TLPs
- **Size:** 32 bits
- **Offset:** B+0x240
- **Exists:** (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 || CX_MEMORY_MAP_PCIE_TYPE==0))

3.48.77 MSIX_ADDRESS_MATCH_HIGH_OFF

- **Name:** MSIX Address Match High Register.
- **Description:** MSI-X Address Match High Register. When you enable the MSI-X Table RAM feature (MSIX_TABLE_EN=1), the controller implements the logic and RAM required to generate MSI-X requests. For more information, see the Interrupts section in the "Controller Operations" chapter of the Databook. This register is only used in AXI configurations. 3.48.88 PL_LTR_LATENCY_OFF

- **Name:** LTR Latency Register.
- **Description:** The function of this register field (and all other fields in this register) differs between an upstream port and a downstream port. For an upstream port, the register fields capture the corresponding fields in the LTR messages that are transmitted by the port. For a downstream port, the register fields capture the corresponding fields in the LTR messages that are received by the port. The full content of the register is reflected on the app_ltr_latency[31:0] output.

Bits	Name	Memory Access	Description
9:0	AUX_CLK_FREQ	R/W	The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: $err\% = (f_prog/f - 1) * 100$. For example if f=2.5 MHz and f_prog=3 MHz, then $err\% = (3/2.5 - 1) * 100 = 20\%$, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). <i>Note:</i> This register field is sticky. 1	POWERDOWN_VMAIN_ACK	R/W	Set this bit to 1 if you do not want to perform the handshake with the power-switch after PERST# assertion. By default the controller will perform the handshake with the power-switch if L1 power gating is enabled <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): If you do not want to perform the handshake with the power-switch after PERST# assertion. Value After Reset: CX_VMAIN_ACK_CTRL_RST_VALUE Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
0	POWERDOWN_FORCE	W	This field is a one shot field. This field could be used for debug purposes in event that the P2 Powerdown transition does not complete. It will allow the controller to proceed with the transition to the P1 Powerdown state. This field always reads back as 1'b0. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): Writing a value of 1 to this field causes the controller to complete the P2 Powerdown handshake regardless of whether the PHY has returned Phystatus. Value After Reset: 0x0 Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true

3.48.92 PHY_INTEROP_CTRL_2_OFF

Bits	Name	Memory Access	Description
11:8	DSP_PCIPM_L1_ENTER_DELAY	R/W	For a DSP component, this register field controls the delay between the reception of PM_Enter_L1 DLLP and the start of PCI-PM L1 entry negotiation in aux clock cycles (1 to 15). When using this feature on legacy DMA configurations, the configured value must be greater than three. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (MIN_VAL): Zero value. ■ 0xf (MAX_VAL): Max value. Value After Reset: CX_DSP_PCIPM_L1_ENTER_DELAY Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

5:0	PMA_PIPE_RST_DELAY_TIMER	R/W	Control how long the controller should wait to release a PIPE reset (pm_req_phy_rst) after releasing a PMA reset (pm_req_phy_perst). This register should only be used to ensure a correct sequencing of the resets into the PHY. If the application needs to delay the PIPE reset arbitrarily, for example to configure the PHY firmware, Synopsys recommends using the app_hold_phy_rst control signal. There is no need to modify the value of this register when using Synopsys PHYs. Duration is in aux clock cycles. <i>Note:</i> This register field is sticky. Values: ■ 0xa (MIN_VAL): Min value. ■ 0x3f (MAX_VAL): Max value. Value After Reset: CX_PMA_PIPE_RST_DELAY_TIMER Exists: (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
22	PHY_VIEWPORT_TIMEOUT_DISABLE	R/W	PHY viewport timeout disable. Disables the PHY register access timeout structure. When the timeout is disabled, you must ensure that the PHY register accesses are always acknowledged by cr_para_ack. Otherwise, PHY_VIEWPORT_PENDING bit will never be de-asserted. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_PHY_VIEWPORT_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
21	PHY_VIEWPORT_BCWR	R/W	Broadcast write access to all xN sub-blocks. If you need to broadcast the write accesses into all lanes, both PHY_VIEWPORT_ADDR[15] and this bit should be 1. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_PHY_VIEWPORT_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))
20	PHY_VIEWPORT_READ	R/W	PHY viewport read. The value is always 0 when this bit is read. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (CLEAR): Clear ■ 0x1 (SET): If set, a read access is initiated. Value After Reset: 0x0 Exists: CX_PHY_VIEWPORT_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0)) Testable: writeAsRead Volatile: true
19:16	PHY_VIEWPORT_NUM	R/W	PHY viewport xN sub-block number. Selects one of xN sub-blocks. This register is not used when the write access is initiated with PHY_VIEWPORT_BCWR ==1. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_PHY_VIEWPORT_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
15:0	PHY_VIEWPORT_ADDR	R/W	PHY viewport address. Indicates the PHY's register address. Refer to the PHY databook for the address map definition. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_PHY_VIEWPORT_ENABLE && (!CX_PL_REG_DISABLE && (CX_MEMORY_MAP_PCIE_TYPE==2 CX_MEMORY_MAP_PCIE_TYPE==0))

Bits	Name	Memory Access	Description
31	DETECTED_PARITY_ERR	R/W1C	Detected Parity Error. Values: ■ 0x1 (SET): This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
30	SIGNALED_SYS_ERR	R/W1C	Signaled System Error. Values: 0x1 (SET): This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL message, and the SERR# Enable bit in the Command register is 1b. For Functions that do not send ERR_FATAL or ERR_NONFATAL messages, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
29	RCVD_MASTER_ABORT	R/W1C	Received Master Abort. Values: 0x1 (SET): This bit is set when a Requester receives a Completion with Unsupported Request Completion Status. For Functions that do not make Non-Posted Requests on their own behalf, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
28	RCVD_TARGET_ABORT	R/W1C	Received Target Abort. Values: 0x1 (SET): This bit is set when a Requester receives a Completion with Completer Abort Completion Status. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
27	SIGNALED_TARGET_ABORT	R/W1C	Signaled Target Abort. Values: 0x1 (SET): This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. The controller hardwires this bit to 0b for Functions that do not signal Completer Abort. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
26:25	DEV_SEL_TIMING	R	DEVSEL Timing. This field was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this field to 00b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
24	MASTER_DPE	R/W1C	Master Data Parity Error. This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs: ■ Function receives a Poisoned Completion ■ Function transmits a Poisoned Request If the Parity Error Response bit is 0b, this bit is never set. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
23	FAST_B2B_CAP	R	Fast Back to Back Transaction Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
22	RSVDP_22	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
21	FAST_66MHZ_CAP	R	66MHz Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
20	CAP_LIST	R	Capabilities List. Indicates the presence of an Extended Capability list item. Since all PCI Express device Functions are required to implement the PCI Express Capability structure, the controller hardwires this bit to 1b. Value After Reset: 0x1 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
19	INT_STATUS	R	Emulation interrupt pending. When set, indicates that an INTx emulation interrupt is pending internally in the Function. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b. Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
18:17	RSVDP_17	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
16	IMM_READINESS	R	Immediate Readiness. This optional bit, when set, indicates the Function is guaranteed to be ready to successfully complete valid configuration accesses at any time following any reset that the host is capable of issuing Configuration Requests to this Function. When this bit is set, for accesses to this Function, software is exempt from all requirements to delay configuration accesses following any type of reset, including but not limited to the timing requirements defined in "PCI Express Reset - Rules" section of the <i>PCI Express Base Specification</i>. It is permitted that system software/firmware provide mechanisms that supersede the indication provided by this bit, however such software/firmware mechanisms are outside the scope of <i>PCI Express Base Specification</i>. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
15:11	PCI_TYPE_RESERV	R	Reserved. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
10	PCI_TYPE0_INT_EN	R	Interrupt Disable. Controls the ability of a Function to generate INTx emulation interrupts. When set, Functions are prevented from asserting INTx interrupts. Note: Any INTx emulation interrupts already asserted by the Function must be de-asserted when this bit is Set. INTx interrupts use virtual wires that must, if asserted, be de-asserted using the appropriate Deassert_INTx message(s) when this bit is set. Only the INTx virtual wire interrupt(s) associated with the Function(s) for which this bit is set are affected. For functions that generate INTx interrupts, this bit is required. For functions that do not generate INTx interrupts, this bit is optional. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
9	RSVDP_9	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
8	PCI_TYPE0_SERREN	R	SERR# Enable. When set, this bit enables reporting upstream of Non-fatal and Fatal errors detected by the Function. Note: The errors are reported if enabled either through this bit or through the PCI Express specific bits in the Device Control register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
7	PCI_TYPE_IDSEL_STEPPING	R	IDSEL Stepping/Wait Cycle Control. This bit was originally described in the <i>PCI Local Bus Specification</i>. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
6	PCI_TYPE0_PARITY_ERR_EN	R	Parity Error Response. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

5	PCI_TYPE_VGA_PALETTE_SNOOP	R	VGA Palette Snoop. This bit was originally described in the <i>PCI Local Bus Specification</i> and the <i>PCI-to-PCI Bridge architecture specification</i>. Its functionality does not apply to PCI Express, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
4	PCI_TYPE_MWI_ENABLE	R	Memory Write and Invalidate. This bit was originally described in the <i>PCI Local Bus Specification</i> and the <i>PCI-to-PCI Bridge architecture specification</i>. Its functionality does not apply to PCI Express, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
3	PCI_TYPE0_SPECIAL_CYCLE_OPERATION	R	Special Cycle Enable. This bit was originally described in the <i>PCI Local Bus Specification</i>. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
2	PCI_TYPE0_BUS_MASTER_EN	* Varies	Bus Master Enable. Controls the ability of a Function to issue Memory and I/O Read/Write requests. ■ When this bit is set, the Function is allowed to issue Memory or I/O Requests. ■ When this bit is clear, the Function is not allowed to issue any Memory or I/O Requests. Requests other than Memory or I/O Requests are not controlled by this bit. <i>Note:</i> MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0 && !SNPS_RSVDPARAM_11) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && SNPS_RSVDPARAM_11) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==2 && !SNPS_RSVDPARAM_11) ? \"read-write\" : \"read-only\""
1	PCI_TYPE0_MEM_SPACE_EN	R	Memory Space Enable. Controls a Function's response to Memory Space accesses. ■ When this bit is set, the Function is enabled to decode the address and further process Memory Space accesses. ■ When this bit is clear, all received Memory Space accesses are caused to be handled as Unsupported Requests. For a Function does not support Memory Space accesses, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
0	PCI_TYPE0_IO_EN	R	IO Space Enable. Controls a Function's response to I/O Space accesses. ■ When this bit is set, the Function is enabled to decode the address and further process I/O Space accesses. ■ When this bit is clear, all received I/O accesses are caused to be handled as Unsupported Requests. For a Function that does not support I/O Space accesses, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

3.49.3 VF_CLASS_CODE_REVISION_ID

- **Name:** Class Code and Revision ID Register.
- **Description:** This register specifies the class code and revision ID of a function.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** CX_MEMORY_MAP_PCIE_TYPE!=1

31:24	BASE_CLASS_CODE
23:16	SUBCLASS_CODE
15:8	PROGRAM_INTERFACE
7:0	REVISION_ID

Table 3-477 Fields for Register: VF_CLASS_CODE_REVISION_ID

Bits	Name	Memory Access	Description
31:24	BASE_CLASS_CODE	R	Base Class Code. A code that broadly classifies the type of operation the Function performs. Encodings for base class, are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. <i>Note:</i> This register field is sticky. Value After Reset: BASE_CLASS_CODE_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
23:16	SUBCLASS_CODE	R	Sub-Class Code. Specifies a base class sub-class, which identifies more specifically the operation of the Function. Encodings for sub-class are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. <i>Note:</i> This register field is sticky. Value After Reset: SUB_CLASS_CODE_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
15:8	PROGRAM_INTERFACE	R	Programming Interface. This field identifies a specific register-level programming interface (if any) so that device independent software can interact with the Function. Encodings for interface are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. <i>Note:</i> This register field is sticky. Value After Reset: IF_CODE_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
7:0	REVISION_ID	R	Revision ID. The value in this register specifies a Function specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Revision ID should be viewed as a vendor defined extension to the Device ID. <i>Note:</i> This register field is sticky. Value After Reset: CX_REVISION_ID_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

3.49.4 VF_BIST_HEADER_TYPE_LATENCY_CACHE_LINE_SIZE_REG

- **Name:** BIST, Header Type, Latency Timer, and Cache Line Size Register.
- **Description:** This register provides the status and controls BIST. It also holds information regarding the header layout, latency timer, and cache line size.
- **Size:** 32 bits
- **Offset:** B+0xc
- **Exists:** CX_MEMORY_MAP_PCIE_TYPE!=1

LATENCY_MASTER_TIMER	15:8
CACHE_LINE_SIZE	7:0

Table 3-478 Fields for Register: VF_BIST_HEADER_TYPE_LATENCY_CACHE_LINE_SIZE_REG

Bits	Name	Memory Access	Description
31:24	BIST	R	BIST. This register is used for control and status of BIST. For Functions that do not support BIST the controller hardwires the register to 00h. A Function whose BIST is invoked must not prevent normal operation of the PCI Express Link. Bit descriptions: ■ [31]: BIST Capable. When Set, this bit indicates that the Function supports BIST. When Clear, the Function does not support BIST. ■ [30]: Start BIST. If BIST Capable is Set, Set this bit to invoke BIST. The Function resets the bit when BIST is complete. Software is permitted to fail the device if this bit is not Clear (BIST is not complete) 2 seconds after it had been Set. Writing this bit to 0b has no effect. This bit must be hardwired to 0b if BIST Capable is Clear. ■ [29:28]: Reserved. ■ [27:24]: Completion Code. This field encodes the status of the most recent test. A value of 0000b means that the Function has passed its test. Non-zero values mean the Function failed. Function-specific failure codes can be encoded in the non-zero values. This field's value is only meaningful when BIST Capable is Set and Start BIST is Clear. This field must be hardwired to 0000b if BIST Capable is clear. Values: ■ 0x0 (Min_field_value): Zero value ■ 0xff (Max_field_value): Max value Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
23	MULTI_FUNC	R	Multi-Function Device. Except where stated otherwise, it is recommended that this bit be set if there are multiple Functions, and clear if there is only one Function. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (SET): Indicates that the Device may contain multiple Functions, but not necessarily. Software is permitted to probe for Functions other than Function 0 ■ 0x0 (CLEAR): Software must not probe for Functions other than Function 0 unless explicitly indicated by another mechanism, such as an ARI or SR-IOV Capability structure. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
22:16	HEADER_TYPE	R	Header Layout. This field identifies the layout of the second part of the predefined header. The controller uses 000 0000b encoding. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
15:8	LATENCY_MASTER_TIMER	R	Latency Timer. The Latency Timer was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this register to 00h. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
7:0	CACHE_LINE_SIZE	R	Cache Line Size. The Cache Line Size register is programmed by the system firmware or the operating system to system cache line size. However, legacy conventional PCI software may not always be able to program this register correctly especially in the case of Hot-Plug devices. This read-write register is implemented for legacy compatibility purposes but has no effect on any PCI Express device behavior. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

3.49.5 VF_BAR0_REG

- **Name:** BAR0 Register.
- **Description:** System software must build a consistent address map before booting the machine to an operating system. This means it has to determine how much memory is in the system, and how much address space the Functions in the system require. After determining this information, system software can map the Functions into reasonable locations and proceed with system boot. In order to do this mapping in a device-independent manner, the base registers for this mapping are placed in the predefined header portion of Configuration Space. It is strongly recommended that power-up firmware/software also support the optional Enhanced Configuration Access Mechanism (ECAM).
- **Size:** 32 bits

3.49.10 VF_BAR5_REG

- **Name:** BAR5 Register.
- **Description:** System software must build a consistent address map before booting the machine to an operating system. This means it has to determine how much memory is in the system, and how much address space the Functions in the system require. After determining this information, system software can map the Functions into reasonable locations and proceed with system boot. In order to do this mapping in a device-independent manner, the base registers for this mapping are placed in the predefined header portion of Configuration Space. It is strongly recommended that power-up firmware/software also support the optional Enhanced Configuration Access Mechanism (ECAM).
- **Size:** 32 bits
- **Offset:** B+0x24
- **Exists:** (PFn_TYPE0_HDR_DBI2.BAR5_MASK_REG.PCI_TYPE0_BAR5_ENABLED || BAR4_-TYPE_n ==2)

3.49.12 VF_SUBSYSTEM_ID_SUBSYSTEM_VENDOR_ID_REG

- **Name:** Subsystem ID and Subsystem Vendor ID Register.
- **Description:** These registers are used to uniquely identify the add-in card or subsystem where the PCI Express component resides. They provide a mechanism for vendors to distinguish their products from one another even though the assemblies may have the same PCI Express component on them (and, therefore, the same Vendor ID and Device ID).
- **Size:** 32 bits

7:0	CAP_POINTER	R	Capabilities Pointer. This register points to a valid capability structure. Either this structure is the PCI Express Capability structure, or a subsequent list item points to the PCI Express Capability structure. The bottom two bits are reserved, the controller sets it to 00b. Software must mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities. <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
15:8	INT_PIN	R	Interrupt Pin. The Interrupt Pin register identifies the legacy interrupt Message(s) the Function uses. All encodings other than the defined encodings are reserved. PCI Express defines one legacy interrupt Message for a single Function device and up to four legacy interrupt Messages for a multi-Function device. For a single Function device, only INTA may be used. Any Function on a multi-Function device can use any of the INTx Messages. If a device implements a single legacy interrupt Message, it must be INTA; if it implements two legacy interrupt Messages, they must be INTA and INTB; and so forth. For a multi-Function device, all Functions may use the same INTx Message or each may have its own (up to a maximum of four Functions) or any combination thereof. A single Function can never generate an interrupt request on more than one INTx Message. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (INTA): Map to legacy interrupt Messages for INTA ■ 0x2 (INTB): Map to legacy interrupt Messages for INTB ■ 0x3 (INTC): Map to legacy interrupt Messages for INTC ■ 0x4 (INTD): Map to legacy interrupt Messages for INTD ■ 0x0 (NO_INT): Indicates that the Function uses no legacy interrupt Message(s). Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
7:0	INT_LINE	R	Interrupt Line. The Interrupt Line register communicates interrupt line routing information. The register must be implemented by any Function that uses an interrupt pin. Values in this register are programmed by system software and are system architecture specific. The Function itself does not use this value; rather the value in this register is used by device drivers and operating systems. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Table 3-489 Fields for Register: VF_CAP_ID_NXT_PTR_REG

Bits	Name	Memory Access	Description
31:27	PME_SUPPORT	* Varies	PME_Support. This 5-bit field indicates the power states in which the function may generate a PME and/or forward PME messages. A value of 0b for any bit indicates that the function is not capable of asserting PME while in that power state. ■ bit(27) X XXX1b - PME can be generated from D0 ■ bit(28) X XX1Xb - PME can be generated from D1 ■ bit(29) X X1XXb - PME can be generated from D2 ■ bit(30) X 1XXXb - PME can be generated from D3hot ■ bit(31) 1 XXXXb - PME can be generated from D3cold Bit 31 (PME can be asserted from D3cold) represents a special case. Functions that set this bit require some sort of auxiliary power source. Implementation specific mechanisms are recommended to validate that the power source is available before setting this bit. The read value from this field is the write value && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where D1_SUPPORT and D2_SUPPORT are fields in this register. The reset value PME_SUPPORT_n && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where PME_SUPPORT_n is a configuration parameter. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R <i>Note:</i> This register field is sticky. Value After Reset: D1_SUPPORT_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
24:22	AUX_CURR	R	Aux_Current. This 3 bit field reports the Vaux auxiliary current requirements for the function. If this function implements the Data Register, the controller hardwires this field to 000b. If PME_Support is 0 xxxb (PME assertion from D3cold is not supported), the controller hardwires this field to 0000b. For functions where PME_Support is 1 xxxb (PME assertion from D3cold is supported), and which do not implement the Data field, the encodings defined in Values: apply: <i>Note:</i> This register field is sticky. 21	DSI	R	Device Specific Initialization. The DSI bit indicates whether special initialization of this function is required. When set, indicates that the function requires a device specific initialization sequence following a transition to the D0uninitialized state. <i>Note:</i> This register field is sticky. Value After Reset: DEV_SPEC_INIT_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
20	PME_IMM_READI_RETURN_DO	R	Immediate_Readiness_on_Return_to_D0. If this bit is a '1', this function is guaranteed to be ready to successfully complete valid accesses immediately after being set to D0. These accesses include configuration cycles, and if the function returns to D0initialized, they also include Memory and I/O Cycles. When this bit is '1', for accesses to this function, software is exempt from all requirements to delay accesses following a transition to D0, including but not limited to the 10ms delay; the delays described in Section 5.9 of <i>PCI Express Base Specification</i>. How this guarantee is established is beyond the scope of this document. It is permitted that your system software/firmware provides mechanisms that supersede the indication provided by this bit, however such software/firmware mechanisms are outside the scope of this document. <i>Note:</i> This register field is sticky. 18:16	PM_SPEC_VER	R	Version. This field provides the Power Management specification version. The controller hardwires this field to 011b for functions compliant to <i>PCI Express Base Specification, Revision 4.0, Version 1.0</i>. <i>Note:</i> This register field is sticky. Value After Reset: 0x3 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
15:8	PM_NEXT_POINTER	R	Next Capability Pointer. This field provides an offset into the function's configuration space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to 00h. <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)
7:0	PM_CAP_ID	R	Capability ID. This field returns 01h to indicate that this is the PCI Power Management Capability. Each function may have only one item in its capability list with Capability ID set to 01h. Value After Reset: 0x1 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

Table 3-490 Fields for Register: VF_CON_STATUS_REG

Bits	Name	Memory Access	Description
31:24	DATA_REG_ADD_INFO	R	Data. This field is used to report the state dependent data requested by the Data_Select field. The value of this field is scaled by the value reported by the Data_Scale field. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

Bits	Name	Memory Access	Description
22	B2_B3_SUPPORT	R	B2B3 Support for D3hot. If this field is set, B2B3 support for D3hot is available. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)
21:16	RSVDP_16	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)
15	PME_STATUS	R/W1C	PME_Status. This bit is set when the function normally generates a PME signal. The value of this bit is not affected by the value of the PME_En bit. If PME_Support bit 31 of the Power Management Capabilities register is clear, this bit is permitted to be hardwired to 0b. Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this register value is not modified by Conventional Reset or FLR. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
14:13	DATA_SCALE	R	Data_Scale. This field indicates the scaling factor to be used when interpreting the value of the Data field. The value and meaning of this field varies depending on which data value has been selected by the Data_Select field. For more information, see 7.5.2.3 section of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)
12:9	DATA_SELECT	R	Data_Select. This 4-bit field is used to select which data is to be reported through the Data and Data_Scale field. If the Data field is not implemented, this field must be hardwired to 0000b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

Bits	Name	Memory Access	Description
8	PME_ENABLE	R/W	PME_En. - When set, the function is permitted to generate a PME. - When clear, the function is not permitted to generate a PME. If PME_Support is 1 xxxxb (PME generation from D3cold) or the function consumes Aux power and Aux power is available this bit is RWS and the bit is not modified by Conventional Reset or FLR. If PME_Support is 0 xxxxb, this field is not sticky (RW). If PME_Support is 0 0000b, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Reset Mask: 0x0 Volatile: true

3	NO_SOFT_RST	R	No_Soft_Reset. This bit indicates the state of the function after writing the PowerState field to transition the function from D3hot to D0. - When set, this transition preserves internal function state. The function is in D0Active and no additional software intervention is required. - When clear, this transition results in undefined internal function state. Regardless of this bit, functions that transition from D3hot to D0 by Fundamental Reset will return to D0Uninitialized with only PME context preserved if PME is supported and enabled. <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_NO_SOFT_RESET_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

1:0	POWER_STATE	* Varies	PowerState. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. You can write to this register; however, the read-back value is the actual power state, not the write value. If you attempt to write an unsupported, optional state to this field, the write operation completes normally; however, the data is discarded and no state change occurs. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (D0): D0 power state ■ 0x1 (D1): D1 power state ■ 0x2 (D2): D2 power state ■ 0x3 (D3hot): D3hot D3hot power state Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_PM_CAP_ENABLE EXT_VF_PM_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Reset Mask: 0x0 Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

3.51.3 VF_MSI_CAP_OFF_08H_REG

- **Name:** Message Address Register for MSI (Offset 08h).
- **Description:** For a function that supports a 32-bit message address,
 - bits[31:16] of this register represent the Extended Message Data, and
 - bits[15:0] of this register represent the Message Data

For a function that supports a 64-bit message address (bit 23 in PCI_MSI_CAP_ID_NEXT_CTRL_REG register set), this register represents the Message Upper Address Register for MSI (Offset 08h). It specifies the Message Upper Address (System-specified message upper address). This register is required for PCI Express Endpoints and is optional for other function types. If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register (if non-zero) specify the upper 32-bits of a 64-bit message address (Address[63:32]). If the contents of this register are zero, the Function uses the 32 bit address specified by the Message Address register.

15:0	PCI_MSI_CAP_OFF_08H

Table 3-493 Fields for Register: VF_MSI_CAP_OFF_08H_REG

Bits	Name	Memory Access	Description
31:16	PCI_MSI_CAP_OFF_0AH	* Varies	For a function that supports a 32-bit message address, this field contains Extended Message Data (System-specified message data). For the MSI Capability structures without per-vector masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is outside the MSI Capability structure and undefined. For the MSI Capability structures with Per-vector Masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is RsvdP. If the Extended Message Data Enable bit (bit 26 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the DWORD Memory Write transaction uses Extended Message Data for the upper 16 bits; otherwise, it uses 0000h for the upper 16 bits. For a function that supports a 64-bit message address, it contains upper 16 bits of the Message Upper Address. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: PCI_MSI_64_BIT_ADDR_CAP `DEFAULT_EXT_MSI_DATA_CAPABLE ? Bits	Name	Memory Access	Description
15:0	PCI_MSI_CAP_OFF_08H	* Varies	For a function that supports a 32-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. For a function that supports a 64-bit message address, it contains lower 16 bits of the Message Upper Address. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_MSI_CAP_ENABLE EXT_VF_MSI_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Memory Access: "(CX_MEMORY_MAP_VIEW==0 && VF_MSI_CONVERT_EN &&(VF_MSI_CAP_ENABLE EXT_VF_MSI_CAP_ENABLE)) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !VF_MSI_CONVERT_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1 && VF_MSI_CONVERT_EN && (VF_MSI_CAP_ENABLE EXT_VF_MSI_CAP_ENABLE)) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !VF_MSI_CONVERT_EN) ? \"read-only\" : (VF_MSI_CONVERT_EN && (VF_MSI_CAP_ENABLE EXT_VF_MSI_CAP_ENABLE)) ? \"read-write\" : \"read-only\" "

3.51.4 VF_MSI_CAP_OFF_0CH_REG

- **Name:** Message Address Register for MSI (Offset 0Ch).
- **Description:** For a function that supports a 32-bit message address, this register contains the Mask Bits when the Per-Vector Masking Capable bit (bit 24 of PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set. For a function that supports a 64-bit message address, this register contains Message Data.

Bits	Name	Memory Access	Description
29:25	PCIE_INT_MSG_NUM	R	PCIE Interrupt Message Number. Interrupt Message Number. This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : PCIE_CAP_INT_MSG_NUM_0} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

19:16	PCIE_CAP_REG	R	Capability Version. Indicates PCI-SIG defined PCI Express Capability structure version number. A version of the specification that changes the PCI Express Capability structure in a way that is not otherwise identifiable (for example, through a new Capability field) is permitted to increment this field. All such changes to the PCI Express Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as functions reporting any such Capability Version numbers will contain a PCI Express Capability structure that is compatible with that piece of software. The controller hardwires this field to 2h for functions compliant to <i>PCI Express Base Specification, Revision 4.0, Version 1.0</i>. <i>Note:</i> This register field is sticky. Value After Reset: 0x2 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
15:8	PCIE_CAP_NEXT_PTR	R	Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
7:0	PCIE_CAP_ID	R	Capability ID. Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure. Value After Reset: 0x10 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
28	PCIE_CAP_FLR_CAP	R	Function Level Reset Capability. A value of 1b indicates the function supports the optional Function Level Reset mechanism described in section 6.6.2 of the <i>PCI Express Base Specification</i>. This bit applies to Endpoints only. For all other function types the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1) ? 0 : CX_FLR_ENABLE_VALUE} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
27:26	PCIE_CAP_CAP_SLOT_PWR_LMT_SCALE	R	Captured Slot Power Limit Scale. Captured Slot Power Limit Scale (Upstream Ports only). Specifies the scale used for the Slot Power Limit Value. This value is set by the Set_Slot_Power_Limit Message or hardwired to 00b (for more details, see section 6.9 of <i>PCI Express Base Specification</i>). Values: ■ 0x0 (_1.0X): 1.0x ■ 0x1 (_0.1X): 0.1x ■ 0x2 (_0.01X): 0.01x ■ 0x3 (_0.001X): 0.001x Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

25:18	PCIE_CAP_CAP_SLOT_PWR_LIMIT_VALUE	R	Captured Slot Power Limit Value. Captured Slot Power Limit Value (Upstream Ports only). In combination with the Captured Slot Power Limit Scale value, specifies the upper limit on power available to the adapter. Power limit (in Watts) is calculated by multiplying the value in this field by the value in the Captured Slot Power Limit Scale field except when the Captured Slot Power Limit Scale field equals 00b (1.0x) and the Captured Slot Power Limit Value exceeds EFh, then alternative encodings are used (for more details, see section 7.5.3.9 of <i>PCI Express Base Specification</i>). This value is set by the Set_Slot_Power_Limit Message or hardwired to 00h (for more details, see section 6.9 of <i>PCI Express Base Specification</i>). Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

15	PCIE_CAP_ROLE_BASED_ERR_REPORT	R	Role-Based Error Reporting. When set, this bit indicates that the function implements the functionality originally defined in the Error Reporting ECN for <i>PCI Express Base Specification, Revision 1.0a</i>, and later incorporated into <i>PCI Express Base Specification, Revision 1.1</i>. This bit must be set by all functions conforming to the ECN, <i>PCI Express Base Specification, Revision 1.1</i>, or subsequent <i>PCI Express Base Specification</i> revisions. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? Bits	Name	Memory Access	Description
11:9	PCIE_CAP_EP_L1_ACCPT_LATENCY	R	Endpoint L1 Acceptable Latency. This field indicates the acceptable latency that an Endpoint can withstand due to the transition from L1 state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L1 Acceptable Latency number to compare against the L1 Exit Latencies reported (see below) by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L1 entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Values: ■ 0x0 (MAX_1US): Maximum of 1 us ■ 0x1 (MAX_2US): Maximum of 2 us ■ 0x2 (MAX_4US): Maximum of 4 us ■ 0x3 (MAX_8US): Maximum of 8 us ■ 0x4 (MAX_16US): Maximum of 16 us ■ 0x5 (MAX_32US): Maximum of 32 us ■ 0x6 (MAX_64US): Maximum of 64 us ■ 0x7 (NO_LIMIT): No limit Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1) ? 0 : DEFAULT_EP_L1_ACCPT_LATENCY} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
8:6	PCIE_CAP_EP_L0S_ACCPT_LATENCY	R	Endpoint L0s Acceptable Latency. This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from L0s state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L0s Acceptable Latency number to compare against the L0s exit latencies reported by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L0s entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Values: ■ 0x0 (MAX_64NS): Maximum of 64 ns ■ 0x1 (MAX_128NS): Maximum of 128 ns ■ 0x2 (MAX_256NS): Maximum of 256 ns ■ 0x3 (MAX_512NS): Maximum of 512 ns ■ 0x4 (MAX_1US): Maximum of 1 us ■ 0x5 (MAX_2US): Maximum of 2 us ■ 0x6 (MAX_4US): Maximum of 4 us ■ 0x7 (NO_LIMIT): No limit Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1) ? 0 : DEFAULT_EP_L0S_ACCPT_LATENCY} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
5	PCIE_CAP_EXT_TAG_SUPP	R/W	Extended Tag Field Supported. This bit, in combination with the 10-Bit Tag Requester Supported bit in the Device Capabilities 2 register, indicates the maximum supported size of the Tag field as a Requester. This bit must be set if the 10-Bit Tag Requester Supported bit is set. <i>Note:</i> 8-bit Tag field generation must be enabled by the Extended Tag Field Enable bit in the Device Control register of the Requester Function before 8-bit Tags can be generated by the Requester. See Section 2.2.6.2 of <i>PCI Express Base Specification</i> for interactions with enabling the use of 10-Bit Tags. Values: 0x0 (_5b_TAG): 5-bit Tag field supported 0x1 (_8b_TAG): 8-bit Tag field supported Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : DEFAULT_EXT_TAG_FIELD_SUPPORTED_0} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
4:3	PCIE_CAP_PHANTOM_FUNC_SUPPORT	R	Phantom Functions Supported. This field indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers (called Phantom Functions) with the Tag identifier (see Section 2.2.6.2 of <i>PCI Express Base Specification</i> for a description of Tag Extensions). With every Function in an ARI Device, the Phantom Functions Supported field must be set to 00b. The remainder of this field description applies only to non-ARI Multi-Function Devices. This field indicates the number of most significant bits of the Function Number portion of Requester ID that are logically combined with the Tag identifier. <i>Note:</i> Phantom Function support for the function must be enabled by the Phantom Functions Enable field in the Device Control register before the Function is permitted to use the Function Number field in the Requester ID for Phantom Functions. <i>Note:</i> This register field is sticky. Values: 0x0 (NO_PHNATOM_FUNC): No Function Number bits are used for Phantom Functions. Multi-Function Devices are permitted to implement up to 8 independent functions. 0x1 (MAX_1_PHANTOM_PER_FUNC): The most significant bit of the Function number in Requester ID is used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-3. Functions 0, 1, 2, and 3 are permitted to use Function Numbers 4, 5, 6, and 7 respectively as Phantom Functions.

Bits	Name	Memory Access	Description
4:3...(cont.)	PCIE_CAP_PHANTOM_FUNC_SUPPORT.	R	0x2 (MAX_3_PHANTOM_PER_FUNC): The two most significant bits of Function Number in Requester ID are used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-1. Function 0 is permitted to use Function Numbers 2, 4, and 6 for Phantom Functions. Function 1 is permitted to use Function Numbers 3, 5, and 7 as Phantom Functions. 0x3 (SINGLE_FUNC_MAX_7_PHANTOM_FUNC): All 3 bits of Function Number in Requester ID used for Phantom Functions. The device must have a single Function 0 that is permitted to use all other Function Numbers as Phantom Functions. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : DEFAULT_PHANTOM_FUNC_SUPPORTED_0} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
2:0	PCIE_CAP_MAX_PAYLOAD_SIZE	R	Max_Payload_Size Supported. This field indicates the maximum payload size that the function can support for TLPs. All encodings other than the defined encodings are reserved. The functions of a Multi-Function Device are permitted to report different values for this field. Values: 0x0 (MAX_128B_SIZE): 128 bytes max payload size 0x1 (MAX_256B_SIZE): 256 bytes max payload size 0x2 (MAX_512B_SIZE): 512 bytes max payload size 0x3 (MAX_1024B_SIZE): 1024 bytes max payload size 0x4 (MAX_2048B_SIZE): 2048 bytes max payload size 0x5 (MAX_4096B_SIZE): 4096 bytes max payload size Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? Bits	Name	Memory Access	Description
22	PCIE_CAP_EMERGENCY_PWR_RED_DETECTED	R	Emergency Power Reduction Detected. When set, this bit indicates that the function is in the Emergency Power Reduction State. Values: ■ 0x0 (CLEAR): Function is not in the Emergency Power Reduction State. ■ 0x1 (SET): Function is in the Emergency Power Reduction State. Value After Reset: 0x0 Exists: EMERGENCY_POWER_REDUCTION_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: untestable Volatile: true
21	PCIE_CAP_TRANS_PENDING	R	Transactions Pending. Endpoints: When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed. A Function reports this bit cleared only when all outstanding Non-Posted Requests have completed or have been terminated by the Completion Timeout mechanism. This bit must also be cleared upon the completion of an FLR. Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
20	PCIE_CAP_AUX_POWER_DETECTED	R	AUX Power Detected. Functions that require Aux power report this bit as set if Aux power is detected by the function. This bit is derived by sampling the sys_aux_pwr_det input. Value After Reset: * Varies Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bits	Name	Memory Access	Description
19	PCIE_CAP_UNSUPPORTED_REQUEST_DETECTED	R/W1C	Unsupported Request Detected. This bit indicates that the function received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function Device, each function indicates status of errors as perceived by the respective function. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
18	PCIE_CAP_FATAL_ERROR_DETECTED	R/W1C	Fatal Error Detected. This bit indicates status of Fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For Functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
17	PCIE_CAP_NON_FATAL_ERROR_DETECTED	R/W1C	Non-Fatal Error Detected. This bit indicates status of Non-fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
16	PCIE_CAP_CORR_ERR_DETECT ED	R/W1C	Correctable Error Detected. This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Correctable Error Mask register. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
15	PCIE_CAP_INITIATE_FLR	W	Initiate Function Level Reset (applicable to Endpoints with Function Level Reset Capability set to 1b). A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b. Value After Reset: 0x0 Exists: (CX_FLR_ENABLE && !CX_PCIE_BRIDGE) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: {(CX_EXTENSIBLE_VFUNC) ? "untestable" : "unconstrained" }

Bits	Name	Memory Access	Description
14:12	PCIE_CAP_MAX_READ_REQ_SIZE	R	Max_Read_Request_Size. This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For functions that do not generate Read Requests larger than 128 bytes and functions that do not generate Read Requests on their own behalf, the controller implements this field as Read Only (RO) with a value of 000b. Values: ■ 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size ■ 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size ■ 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size ■ 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size ■ 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size ■ 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size ■ 0x6 (RESERVED1): RESERVED ■ 0x7 (RESERVED2): RESERVED Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
11	PCIE_CAP_EN_NO_SNOOP	R	Enable No Snoop. If this bit is set, the function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency (see section 2.2.6.5 in <i>PCI Express Base Specification</i>). <i>Note:</i> Setting this bit to 1b should not cause a function to set the No Snoop attribute on all transactions that it initiates. Even when this bit is set, a function is only permitted to set the No Snoop attribute on a transaction when it can guarantee that the address of the transaction is not stored in any cache in the system. The controller hardwires this bit 0b if a function would never set the No Snoop attribute in transactions it initiates. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
10	PCIE_CAP_AUX_POWER_PM_EN	R	Aux Power PM Enable. This bit is derived by sampling the sys_aux_pwr_det input. When set this bit, enables a function to draw Aux power independent of PME Aux power. Functions that require Aux power on legacy operating systems should continue to indicate PME Aux power requirements. Aux power is allocated as requested in the Aux_Current field of the Power Management Capabilities register (PMC), independent of the PME_En bit in the Power Management Control/Status register (PMCSR). For Multi-Function devices, a component is allowed to draw Aux power if at least one of the functions has this bit set. <i>Note:</i> Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this bit is not modified by Conventional Reset. For functions that do not implement this capability, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
9	PCIE_CAP_PHANTOM_FUNC_EN	R	Phantom Functions Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, ■ If this bit is set, it enables a function to use unclaimed functions as Phantom functions to extend the number of outstanding transaction identifiers ■ If this bit is clear, the function is not allowed to use Phantom functions For more information, see section 2.2.6.2 of <i>PCI Express Base Specification</i>. Software should not change the value of this bit while the function has outstanding Non-Posted Requests; otherwise, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
8	PCIE_CAP_EXT_TAG_EN	R	Extended Tag Field Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, ■ If the Extended Tag Field Enable bit is set, the function is permitted to use an 8-bit Tag field as a Requester ■ If the Extended Tag Field Enable bit is clear, the Function is restricted to a 5-bit Tag field See section 2.2.6.2 of <i>PCI Express Base Specification</i> for required behavior when the 10-Bit Tag Requester Enable bit is set. If software changes the value of the Extended Tag Field Enable bit while the function has outstanding Non-Posted Requests, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
7:5	PCIE_CAP_MAX_PAYLOAD_SIZE_CS	R	Max_Payload_Size. This field sets maximum TLP payload size for the Function. As a Receiver, the Function must handle TLPs as large as the set value. As a Transmitter, the Function must not generate TLPs exceeding the set value. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities (DEVICE_CAPABILITIES_REG) register (for more details, see section 7.5.3.3 of <i>PCI Express Base Specification</i>). This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For Functions that support only the 128-byte max payload size, the controller hardwires this field to 000b. System software is not required to program the same value for this field for all the Functions of a Multi-Function device (for more details, see section 2.2.2 of <i>PCI Express Base Specification</i>). For ARI Devices, Max_Payload_Size is determined solely by the setting in Function0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Values: ■ 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size ■ 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size ■ 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size ■ 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size ■ 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size ■ 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size ■ 0x6 (RESERVED1): RESERVED ■ 0x7 (RESERVED2): RESERVED Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
4	PCIE_CAP_EN_REL_ORDER	R	Enable Relaxed Ordering. If this bit is set, the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering (for more details, see section 2.2.6.4 and section 2.4 of <i>PCI Express Base Specification</i>). For a function that never sets the Relaxed Ordering attribute in transactions it initiates as a Requester, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
3	PCIE_CAP_UNSUPPORT_REQ_REP_EN	R	Unsupported Request Reporting Enable. This bit, in conjunction with other bits, controls the signaling of Unsupported Request Errors by sending error Messages (for more details, see section 6.2.5 and section 6.2.6 of <i>PCI Express Base Specification</i>). For a Multi-Function Device, this bit controls error reporting for each Function from point-of-view of the respective Function. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
2	PCIE_CAP_FATAL_ERR_REPORT_EN	R	Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (for more details, see section 6.2.5 and section 6.2.6 of <i>PCI Express Base Specification</i>). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of Fatal errors is internal to the root. No external ERR_FATAL Message is generated. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
1	PCIE_CAP_NON_FATAL_ERR_REPORT_EN	R	Non-Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (for more details, see section 6.2.5 and Section 6.2.6 of <i>PCI Express Base Specification</i>). For a Multi-Function Device, this bit controls error reporting for each function from point-of-view of the respective Function. For a Root Port, the reporting of Non-fatal errors is internal to the root. No external ERR_NONFATAL Message is generated. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

0	PCIE_CAP_CORR_ERR_REPOR T_EN	R	Correctable Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_COR Messages (for more details, see section 6.2.5, section 6.2.6, and section 6.2.10.2 of <i>PCI Express Base Specification</i>). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_COR Message is generated. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Table 3-500 Fields for Register: VF_LINK_CAPABILITIES_REG

Bits	Name	Memory Access	Description
31:24	PCIE_CAP_PORT_NUM	R	Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Value After Reset: PORT_NUM Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: untestable Volatile: true

Bits	Name	Memory Access	Description
23	RSVDP_23	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
22	PCIE_CAP_ASPM_OPT_COMPLIANCE	R	ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: untestable Volatile: true
21	PCIE_CAP_LINK_BW_NOT_CAP	R	Link Bandwidth Notification Capability. A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. This capability is required for all Root Ports and Switch Downstream Ports supporting Links wider than x1 and/or multiple Link speeds. This field is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
20	PCIE_CAP_DLL_ACTIVE_REP_CAP	R	Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
19	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP	R	Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
18	PCIE_CAP_CLOCK_POWER_MAN	R	Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) through the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: DEFAULT_CLK_PM_CAP Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
17:15	PCIE_CAP_L1_EXIT_LATENCY	R	L1 Exit Latency. This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. <i>Note:</i> Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: ■ CX_NFTS !=CX_COMM_NFTS ■ DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY ■ DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Values: ■ 0x0 (LESS_THAN_1US): Less than 1us ■ 0x1 (_1US_TO_2US): 1 us to less than 2 us ■ 0x2 (_2US_TO_4US): 2 us to less than 4 us

Bits	Name	Memory Access	Description
14:12	PCIE_CAP_L0S_EXIT_LATENCY	R	L0s Exit Latency. This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. If L0s is not supported, the value is undefined; however, see the Implementation Note "Potential Issues With Legacy Software When L0s is Not Supported" in section 5.4.1.1 of <i>PCI Express Base Specification</i> for the recommended value. <i>Note:</i> Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: ■ CX_NFTS !=CX_COMM_NFTS ■ DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY ■ DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Values:

9:4	PCIE_CAP_MAX_LINK_WIDTH	R	Maximum Link Width. This field indicates the maximum Link width (xN - corresponding to N Lanes) implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. All encodings other than the defined encodings are reserved. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. Values: ■ 0x1 (X1): x1 ■ 0x2 (X2): x2 ■ 0x4 (X4): x4 ■ 0x8 (X8): x8 ■ 0xc (X12): x12 ■ 0x10 (X16): x16 ■ 0x20 (X32): x32 Value After Reset: CX_NL Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Table 3-501 Fields for Register: VF_LINK_CONTROL_LINK_STATUS_REG

Bits	Name	Memory Access	Description
31	PCIE_CAP_LINK_AUTO_BW_STATUS	* Varies	Link Autonomous Bandwidth Status. This bit is set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RSVDP ■ Dbi: R Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

Bits	Name	Memory Access	Description
30	PCIE_CAP_LINK_BW_MAN_STAT US	* Varies	Link Bandwidth Management Status. This bit is set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit. <i>Note:</i> This bit is set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. The default value of this bit is 0b. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RSVDP ■ Dbi: R Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""
29	PCIE_CAP_DLL_ACTIVE	R	Data Link Layer Link Active. This bit indicates the status of the Data Link Control and Management State Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. This bit must be implemented if the Data Link Layer Link Active Reporting Capable bit is 1b. Otherwise, the controller hardwires it to 0b. Value After Reset: 0x0 Exists: (CX_MEMORY_MAP_PCIE_TYPE<2) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
28	PCIE_CAP_SLOT_CLK_CONFIG	* Varies	Slot Clock Configuration. This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For a Multi-Function Device, each Function must report the same value for this bit. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: * Varies Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
27	PCIE_CAP_LINK_TRAINING	* Varies	Link Training. This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches, and the controller hardwires it to 0b. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RSVDP ■ Dbi: R Value After Reset: * Varies Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

25:20	PCIE_CAP_NEGO_LINK_WIDTH	R	Negotiated Link Width. This field indicates the negotiated width of the given PCI Express Link. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up. Values: ■ 0x1 (X1): x1 ■ 0x2 (X2): x2 ■ 0x4 (X4): x4 ■ 0x8 (X8): x8 ■ 0xc (X12): x12 ■ 0x10 (X16): x16 ■ 0x20 (X32): x32 Value After Reset: * Varies Exists: (CX_MEMORY_MAP_PCIE_TYPE<2) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bits	Name	Memory Access	Description
19:16	PCIE_CAP_LINK_SPEED	R	Current Link Speed. This field indicates the negotiated Link speed of the given PCI Express Link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up. Values: ■ 0x1 (SUP_LINK_SPEED_FIELD_BIT_0): Supported Link Speeds Vector field bit 0 ■ 0x2 (SUP_LINK_SPEED_FIELD_BIT_1): Supported Link Speeds Vector field bit 1 ■ 0x3 (SUP_LINK_SPEED_FIELD_BIT_2): Supported Link Speeds Vector field bit 2 ■ 0x4 (SUP_LINK_SPEED_FIELD_BIT_3): Supported Link Speeds Vector field bit 3 ■ 0x5 (SUP_LINK_SPEED_FIELD_BIT_4): Supported Link Speeds Vector field bit 4 ■ 0x6 (SUP_LINK_SPEED_FIELD_BIT_5): Supported Link Speeds Vector field bit 5 ■ 0x7 (SUP_LINK_SPEED_FIELD_BIT_6): Supported Link Speeds Vector field bit 6 Value After Reset: * Varies Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bits	Name	Memory Access	Description
15:14	PCIE_CAP_DRS_SIGNALING_CONTROL	R	DRS Signaling Control. Indicates the mechanism used to report reception of a DRS message. Must be implemented for Downstream Ports with the DRS Supported bit Set in the Link Capabilities 2 Register. Encodings are: If DRS Supported is set, receiving a DRS Message will set DRS Message Received in the Link Status 2 Register but will otherwise have no effect If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, and either MSI or MSI-X is enabled, an MSI or MSI-X interrupt is generated using the vector in Interrupt Message Number (section 7.5.3.2) If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, the Port must send an FRS Message Upstream with the FRS Reason field set to DRS Message Received. Behavior is undefined if this field is set to 10b and the FRS Supported bit in the Device Capabilities 2 Register is Clear. Behavior is undefined if this field is set to 11b. For Downstream Ports with the DRS Supported bit clear in the Link Capabilities 2 register, the controller hardwires this field to 00b. This field is Reserved for Upstream Ports. Values: ■ 0x0 (DRS_NOT_REPORTED): DRS not Reported ■ 0x1 (DRS_INTERRUPT_EN): DRS Interrupt Enabled ■ 0x2 (FRS_EN): DRS to FRS Signaling Enabled Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
11	PCIE_CAP_LINK_AUTO_BW_INT_EN	* Varies	Link Autonomous Bandwidth Management Interrupt Enable. When set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been set. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? RW : RO ■ Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? 10	PCIE_CAP_LINK_BW_MAN_INT_EN	* Varies	Link Bandwidth Management Interrupt Enable. When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? Bits	Name	Memory Access	Description
9	PCIE_CAP_HW_AUTO_WIDTH_DISABLE	R	Hardware Autonomous Width Disable. When set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. For components that do not implement the ability autonomously to change Link width, the controller hardwires this bit to 0b. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
8	PCIE_CAP_EN_CLK_POWER_MAN	* Varies	Enable Clock Power Management. Applicable only for Upstream Ports and with form factors that support a "Clock Request" (CLKREQ#) mechanism, this bit operates as follows: For a non-ARI Multi-Function Device, power-management-configuration software must only Set this bit if all Functions of the Multi-Function Device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled through the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. For Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register), the controller hardwires this bit to 0b. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in LINK_CAPABILITIES_REG. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS ■ Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS <i>Note:</i> This register field is sticky. Values: ■ 0x0 (PM_DISABLE_LOW_CLKREQ): Clock power management is disabled and device must hold CLKREQ# signal low.
8...(cont.)	PCIE_CAP_EN_CLK_POWER_MAN.	* Varies	■ 0x1 (CLKREQ_IN_USE): When this bit is set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined in appropriate form factor specification. Bits	Name	Memory Access	Description
7	PCIE_CAP_EXTENDED_SYNCH	R/W	Extended Synch. When set, this bit forces the transmission of additional Ordered Sets when exiting the L0s state (see section 4.2.4.5 of <i>PCI Express Base Specification</i>) and when in the Recovery state (see section 4.2.6.4.1 of <i>PCI Express Base Specification</i>). This mode provides external devices (for example, logic analyzers) monitoring the Link time to achieve bit and Symbol lock before the Link enters the L0 state and resumes communication. For Multi-Function devices if any function has this bit set, then the component must transmit the additional Ordered Sets when exiting L0s or when in Recovery. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
6	PCIE_CAP_COMMON_CLK_CONFIG	R	Common Clock Configuration. When set, this bit indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock. For non-ARI Multi-Function Devices, software must program the same value for this bit in all Functions. If not all Functions are Set, then the component must as a whole assume that its reference clock is not common with the Upstream component. For ARI Devices, Common Clock Configuration is determined solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Components utilize this common clock configuration information to report the correct L0s and L1 Exit Latencies. After changing the value in this bit in both components on a Link, software must trigger the Link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port. Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
5	PCIE_CAP_RETRAIN_LINK	* Varies	Retrain Link. A write of 1b to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. If the LTSSM is already in Recovery or Configuration, re-entering Recovery is permitted but not required. If the Port is in DPC when a write of 1b to this bit occurs, the result is undefined. Reads of this bit always return 0b. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress. This bit is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. This bit always returns 0b when read. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: see description ■ Dbi: see description Value After Reset: * Varies Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bits	Name	Memory Access	Description
4	PCIE_CAP_LINK_DISABLE	* Varies	Link Disable. This bit disables the Link by directing the LTSSM to the Disabled state when set; this bit is Reserved on Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Writes to this bit are immediately reflected in the value read from the bit, regardless of actual Link state. After clearing this bit, software must honor timing requirements defined in Section 6.6.1 with respect to the first Configuration Read following a Conventional Reset. In a DSP that supports crosslink, the controller gates the write value with the CROSS_LINK_EN field in PORT_LINK_CTRL_OFF. Note: The access attributes of this field are as follows: ■ Wire: CX_CROSSLINK_ENABLE=1 && PORT_LINK_CTRL_OFF.CROSS_LINK_EN=1 CX_CROSSLINK_ENABLE=0 && dsp=1 ? RW : RO ■ Dbi: CX_CROSSLINK_ENABLE=1 && PORT_LINK_CTRL_OFF.CROSS_LINK_EN=1 CX_CROSSLINK_ENABLE=0 && dsp=1? 3	PCIE_CAP_RCB	R	Read Completion Boundary (RCB). <i>Endpoints and Bridges:</i> Optionally set by configuration software to indicate the RCB value of the Root Port Upstream from the Endpoint or Bridge. Refer to Section 2.3.1.1 of <i>PCI Express Base Specification</i> for the definition of the parameter RCB is same as Root Port. Configuration software must only set this bit if the Root Port Upstream from the Endpoint or Bridge reports an RCB value of 128 bytes (a value of 1b in the Read Completion Boundary bit). For functions that do not implement this feature, the controller hardwires this bit to 0b. Values: ■ 0x0 (_64B): 64 byte ■ 0x1 (_128B): 128 byte Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
2	RSVDP_2	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
1:0	PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL	R	Active State Power Management (ASPM) Control. This field controls the level of ASPM enabled on the given PCI Express Link. See section 5.4.1.3 of <i>PCI Express Base Specification</i> for requirements on when and how to enable ASPM. <i>Note:</i> "L0s Entry Enabled" enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). ASPM L1 must be enabled by software in the Upstream component on a Link prior to enabling ASPM L1 in the Downstream component on that Link. When disabling ASPM L1, software must disable ASPM L1 in the Downstream component on a Link prior to disabling ASPM L1 in the Upstream component on that Link. ASPM L1 must only be enabled on the Downstream component if both components on a Link support ASPM L1. For Multi-Function Devices (including ARI Devices), it is recommended that software program the same value for this field in all Functions. For non-ARI Multi-Function Devices, only capabilities enabled in all Functions are enabled for the component as a whole. For ARI Devices, ASPM Control is determined solely by the setting in Function0, regardless of Function 0's D-state. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined. Values: ■ 0x0 (DISABLED): Disabled ■ 0x1 (L0S_ENTRY_EN): L0s Entry Enabled ■ 0x2 (L1_ENTRY_EN): L1 Entry Enabled ■ 0x3 (L0S_L1_ENTRY_EN): L0s and L1 Entry Enabled Value After Reset: 0x0 Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
31	PCIE_CAP_FRS_SUPPORTED	* Varies	FRS Supported. When set, indicates support for the optional Function Readiness Status (FRS) capability. Must be set for all Functions that support generation or reception capabilities of FRS Messages. Must not be set by Switch Functions that do not generate FRS Messages on their own behalf. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) and more specifically: (CX_MEMORY_MAP_PCIE_TYPE==1 && 1) ? 30:29	PCIE_CAP_DMWR_LEN_SUPP	R	Deferrable Memory Write (DMWr) Lengths Supported. Applicable to Functions with either the DMWr Routing Supported bit Set or the DMWr Completer Supported bit Set (or both). This field indicates the largest DMWr TLP that this Function can receive. When applicable, all Functions in a Multi-Function Device associated with an Upstream Port must report the same value in this field. This field is RsvdP if both DMWr Completer Supported and DMWr Routing Supported are Clear. For more information, see Section 6.30 of <i>PCI Express Base Specification</i>. Values: ■ 0x0 (up_to_64_bytes): 0 up to 64 bytes ■ 0x1 (up_to_128_bytes): 1 up to 128 bytes Value After Reset: {((CX_DEF_MEM_WR_CPL_EN==1) (CX_DEF_MEM_WR_ROUTING_EN==1)) ? Bits	Name	Memory Access	Description
28	PCIE_CAP_DMWR_CPL_SUPP	R	Deferrable Memory Write (DMWr) Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; This bit must be Set if the Function can serve as a DMWr Completer. For more information, see Section 6.30 of <i>PCI Express Base Specification</i>. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_DEF_MEM_WR_CPL_EN} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
27	RSVDP_27	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
26	PCIE_CAP2_EMERGENCY_PWR_RED_INIT_REQUIRED	* Varies	Emergency Power Reduction Initialization Required. Indicates if Software initialization upon exit from the Emergency Power Reduction State is required. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Values: ■ 0x0 (CLEAR): The Function requires no software intervention to return to normal operation upon exit from the Emergency Power Reduction State. ■ 0x1 (SET): The Function requires complete or partial initialization upon exit from the Emergency Power Reduction State. Bits	Name	Memory Access	Description
25:24	PCIE_CAP2_EMERGENCY_PWR_RED_SUPPORT	* Varies	Emergency Power Reduction Supported. Indicates support level of the optional Emergency Power Reduction State feature. For Multi-Function Devices associated with an Upstream Port, all Functions that report a non-zero value for this field, must report the same non-zero value for this field. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: HWINIT ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Values: ■ 0x0 (NO_SUP): Emergency Power Reduction State not supported. ■ 0x1 (SUP_01b): Emergency Power Reduction State is supported and is triggered by Device Specific mechanism(s). ■ 0x2 (SUP_10b): Emergency Power Reduction State is supported and is triggered either by the mechanism defined in the corresponding Form Factor specification or by Device Specific mechanism(s). ■ 0x3 (RSVD_4): Reserved Value After Reset: 0x0 Exists: EMERGENCY_POWER_REDUCTION_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

Bits	Name	Memory Access	Description
23:22	PCIE_CAP2_CFG_MAX_END2END_TLP_PRFXS	R	Max End-End TLP Prefixes. Indicates the maximum number of End-End TLP Prefixes supported by this Function. For more information, see Section 2.2.10.2 of <i>PCI Express Base Specification</i>. If End-End TLP Prefix Supported is clear, this field is RsvdP. Different Root Ports that have the End-End TLP Prefix Supported bit set are permitted to report different values for this field. For Switches where End-End TLP Prefix Supported is set, this field must be 00b indicating support for up to four End-End TLP Prefixes. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ONE_END_END_TLP_PREFIX): 1 End-End TLP Prefix ■ 0x2 (TWO_END_END_TLP_PREFIX): 2 End-End TLP Prefixes ■ 0x3 (THREE_END_END_TLP_PREFIX): 3 End-End TLP Prefixes ■ 0x0 (FOUR_END_END_TLP_PREFIX): 4 End-End TLP Prefixes Value After Reset: 0x0 Exists: CX_TLP_PREFIX_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
21	PCIE_CAP2_CFG_END2END_TLP_PRFX_SUPPORT	R	End-End TLP Prefix Supported. Indicates whether End-End TLP Prefix support is offered by a Function. Values are: All Ports of a Switch must have the same value for this bit. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NO_SUP): No Support ■ 0x1 (SUP): Support is provided to receive TLPs containing End-End TLP Prefixes. Value After Reset: 0x0 Exists: CX_TLP_PREFIX_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
20	PCIE_CAP2_CFG_EXTND_FMT_SUPPORT	R	Extended Fmt Field Supported. If set, the Function supports the 3-bit definition of the Fmt field. If clear, the Function supports a 2-bit definition of the Fmt field. For more information, see section 2.2 of <i>PCI Express Base Specification</i>. Must be set for Functions that support End-End TLP Prefixes. All Functions in an Upstream Port must have the same value for this bit. Each Downstream Port of a component may have a different value for this bit. It is strongly recommended that Functions support the 3-bit definition of the Fmt field. <i>Note:</i> This register field is sticky. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? Bits	Name	Memory Access	Description
19:18	PCIE_CAP_OBFF_SUPPORT	R	OBFF Supported. This field indicates if OBFF is supported and, if so, what signaling mechanism is used. The value reported in this field must indicate support for WAKE# signaling only if: ■ for a Downstream Port, driving the WAKE# signal for OBFF is supported and the connector or component connected Downstream is known to receive that same WAKE# signal ■ for an Upstream Port, receiving the WAKE# signal for OBFF is supported and, if the component is on an add-in-card, that the component is connected to the WAKE# signal on the connector. Root Ports, Switch Ports, and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this field. For Bridges and Ports that do not implement this capability, the controller hardwires this field to 00b. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NOT_SUP): OBFF Not Supported ■ 0x1 (SUP_USING_MSG): OBFF supported using Message signaling only ■ 0x2 (SUP_USING_WAKE): OBFF supported using WAKE# signaling only ■ 0x3 (SUP_USING_MSG_AND_WAKE): OBFF supported using WAKE# and Message signaling Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_OBFF_SUPPORT} Exists: CX_OBFF_SUPPORT && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
17	PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT	R	10-Bit Tag Requester Supported. If this bit is set, the Function supports 10-Bit Tag Requester capability; otherwise, the Function does not. This bit must not be set if the 10-Bit Tag Completer Supported bit is clear. <i>Note:</i> 10-Bit Tag field generation must be enabled by the 10-Bit Tag Requester Enable bit in the Device Control 2 register of the Requester Function before 10-Bit Tags can be generated by the Requester. For more information, see section 2.2.6.2. of <i>PCI Express Base Specification</i>. 16	PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT	R	10-Bit Tag Completer Supported. If this bit is set, the Function supports 10-Bit Tag Completer capability; otherwise, the Function does not. For more information, see section 2.2.6.2. of <i>PCI Express Base Specification</i>. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_10BITS_TAG_VALUE} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
15:14	PCIE_CAP2_LN_SYS_CLS	R	LN System CLS. Applicable only to Root Ports and RCRBs; must be 00b for all other Function types. This field indicates if the Root Port or RCRB supports LN protocol as an LN Completer, and if so, what cacheline size is in effect. All encodings other than the defined encodings are reserved. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (LN_COMPLETER_NO_SUP): LN Completer either not supported or not in effect ■ 0x1 (LN_COMPLETER_64B_CACHE): LN Completer with 64-byte cachelines in effect ■ 0x2 (LN_COMPLETER_128B_CACHE): LN Completer with 128-byte cachelines in effect Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
13	PCIE_CAP_TPH_CMPLT_SUPP_ORT_1	R	TPH Completer Supported Bit 1. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
12	PCIE_CAP_TPH_CMPLT_SUPP0RT_0	R	TPH Completer Supported Bit 0. Value of this bit along with TPH Completer Supported Bit 1 indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. For all other Functions, this field is Reserved. For more information, see section 6.17 of <i>PCI Express Base Specification</i>. Values: 0x0 (TPH_EXT_TPH_CMPL_NOT_SUP_OR_RSVD): TPH and Extended TPH Completer not supported (if TPH Completer Supported Bit is 0) or Reserved (if TPH Completer Supported Bit is 1). 0x1 (TPH_SUP_EXT_TPH_NOT_SUP_OR_BOTH_SUPP): TPH Completer supported; Extended TPH Completer not supported (if TPH Completer Supported Bit is 0) or Both TPH and Extended TPH Completer supported (if TPH Completer Supported Bit is 1). Value After Reset: $\{((VF_TPH_ENABLE==1) (EXT_VF_TPH_ENABLE==1)) ? CX_TPH_ENABLE_VALUE : 0\}$ Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
11	PCIE_CAP_LTR_SUPP	R	LTR Mechanism Supported. A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this bit. For Bridges and other Functions that do not implement this capability, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: $\{(CX_MEMORY_MAP_PCIE_TYPE==1 \&\& !CX_MEMORY_MAP_POSITION) ? 0 : CX_LTR_M_ENABLE_VALUE\}$ Exists: CX_LTR_M_ENABLE_VALUE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

10	PCIE_CAP_NO_RO_EN_PR2PR_PAR	R	No RO-enabled PR-PR Passing. If this bit is set, the routing element never carries out the passing permitted by Table 2-39 of <i>PCI Express Base Specification</i> entry A2b that is associated with the Relaxed Ordering Attribute field being Set. This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports. This bit applies only to Posted Requests being forwarded through the Switch or RC and does not apply to traffic originating or terminating within the Switch or RC itself. All Ports on a Switch or RC must report the same value for this bit. For all other functions, this bit must be 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
9	PCIE_CAP_128_CAS_CPL_SUPP	R	128-bit CAS Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. This bit must be set to 1b if the Function supports this optional capability. For more information, see section 6.15 of <i>PCI Express Base Specification</i>. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_ATOMIC_128_CAS_EN} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
8	PCIE_CAP_64_ATOMIC_CPL_SU PP	R	64-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more information on additional RC requirements, see section 6.15.3.1 of <i>PCI Express Base Specification</i>. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_ATOMIC_64_CPL_EN} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
7	PCIE_CAP_32_ATOMIC_CPL_SUPP	R	32-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more information on additional RC requirements, see section 6.15.3.1 of <i>PCI Express Base Specification</i>. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : CX_ATOMIC_32_CPL_EN} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
6	PCIE_CAP_ATOMIC_ROUTING_SUPP	R	AtomicOp Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more information, see section 6.15 of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
5	PCIE_CAP_ARI_FORWARD_SUPPORT	R	ARI Forwarding Supported. Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. For more information, see section 6.13 of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
4	PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT	R	Completion Timeout Disable Supported. A value of 1b indicates support for the Completion Timeout Disable mechanism. The Completion Timeout Disable mechanism is required for Endpoints that issue Requests on their own behalf and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. This mechanism is optional for Root Ports. For all other Functions this field is Reserved and the controller hardwires this bit to 0b. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? "0x0" : "0x1"} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
3:0	PCIE_CAP_CPL_TIMEOUT_RANGE	R	Completion Timeout Ranges Supported. This field indicates device Function support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and must be hardwired to 0000b. Four time value ranges are defined: ■ Range A: 50 us to 10 ms ■ Range B: 10 ms to 250 ms ■ Range C: 250 ms to 4 s ■ Range D: 4 s to 64 s Bits are set according to the list below to show timeout value ranges supported. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms. Values: ■ 0x0 (NOT_SUP): Completion Timeout programming not supported, the Function must implement a timeout value in the range 50 us to 50 ms. ■ 0x1 (RANGE_A): Range A ■ 0x2 (RANGE_B): Range B ■ 0x3 (RANGE_A_B): Ranges A and B ■ 0x6 (RANGE_B_C): Ranges B and C ■ 0x7 (RANGE_A_B_C): Ranges A, B, and C ■ 0xe (RANGE_B_C_D): Ranges B, C, and D ■ 0xf (RANGE_A_B_C_D): Ranges A, B, C, and D Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? "0x0" : ((CX_CPL_TO_RANGES_ENABLE==1) ? 0xf : 0)} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
15	PCIE_CTRL2_CFG_END2END_TLP_PFX_BLK	R	End-End TLP Prefix Blocking. Controls whether the routing function is permitted to forward TLPs containing an End-End TLP Prefix. This bit affects TLPs that exit the Switch/Root Complex using the associated Port. It does not affect TLPs forwarded internally within the Switch/Root Complex. It does not affect TLPs that enter through the associated Port, that originate in the associated Port or originate in a Root Complex Integrated Device integrated with the associated Port. Blocked TLPs are reported by the TLP Prefix Blocked Error. This bit is hardwired to 1b in Root Ports that support End-End TLP Prefixes but do not support forwarding of End-End TLP Prefixes. This bit is applicable to Root Ports and Switch Ports where the End-End TLP Prefix Supported bit is set. This bit is not applicable and is RsvdP in all other cases. Values: ■ 0x0 (FORWARDING_EN): Forwarding Enabled, Function is permitted to send TLPs with End-End TLP Prefixes. ■ 0x1 (FORWARDING_BLK): Forwarding Blocked, Function is not permitted to send TLPs with End-End TLP Prefixes. Value After Reset: 0x0 Exists: CX_TLP_PREFIX_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
14:13	PCIE_CAP_OBFF_EN	R	OBFF Enable. This field enables the OBFF mechanism and selects the signaling method. For more information on these encodings, see section 6.19 of <i>PCI Express Base Specification</i>. This field is required for all Ports that support the OBFF Capability. For a Multi-Function Device associated with an Upstream Port of a Device that implements OBFF, the field in Function 0 is of type RW, and only Function 0 controls the Component's behavior. In all other Functions of that Device, this field is of type RsvdP. Ports that do not implement OBFF are permitted to hardwire this field to 00b Note: RW for function #0 and RsvdP for all other functions. Values: ■ 0x0 (DISABLED): Disabled ■ 0x1 (EN_USING_MSG_SIG_A): Enabled using Message signaling [Variation A] ■ 0x2 (EN_USING_MSG_SIG_B): Enabled using Message signaling [Variation B] ■ 0x3 (EN_USING_WAKE_SIG): Enabled using WAKE# signaling Value After Reset: 0x0 Exists: CX_OBFF_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
12	PCIE_CAP_10BITS_TAG_REQ_EN	R	10-Bit Tag Requester Enable. 10-Bit Tag Requester Enable. This bit, in combination with the Extended Tag Field Enable bit in the Device Control register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is Set, the Requester is permitted to use 10-Bit Tags. For more information, see section 2.2.6.2 of <i>PCI Express Base Specification</i>. If software changes the value of this bit while the Function has outstanding Non-Posted Requests, the result is undefined. Functions that do not implement 10-Bit Tag Requester capability are permitted to hardwire this bit to 0b. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : 0} Exists: CX_10BITS_TAG_REQ && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

11	PCIE_CAP_EMERGENCY_PWR_RED_REQUEST	* Varies	Emergency Power Reduction Request. This bit is implemented in the lowest numbered Function associated with an Upstream Port that has a non-zero value in the Emergency Power Reduction Supported field. This bit is RsvdP in all other Functions. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: RSVDZ ■ Dbi: RSVDZ Values: ■ 0x0 (CLEAR): If Clear these Functions must exit the Emergency Power Reduction State if no other reasons exist to preclude exiting this state. ■ 0x1 (SET): If Set, all Functions in the component that support Emergency Power Reduction State must enter the Emergency Power Reduction State. Value After Reset: 0x0 Exists: EMERGENCY_POWER_REDUCTION_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Memory Access: "(CX_MEMORY_MAP_VIEW==0 && 0==0) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1 && 0==0) ? \"read-only\": \"read-only\" "

Bits	Name	Memory Access	Description
10	PCIE_CAP_LTR_EN	* Varies	LTR Mechanism Enable. When set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages. For a Multi-Function Device associated with an Upstream Port of a device that implements LTR, the bit in Function 0 is RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is RsvdP. Functions that do not implement the LTR mechanism are permitted to hardwire this bit to 0b. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. The write value is gated with the PCIE_CAP_LTR_SUPP field of DEVICE_CAPABILITIES2_REG. <i>Note:</i> RW for function #0 and RsvdP for all other functions. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: if (pf=0 && DEVICE_CAPABILITIES2_REG.PCIE_CAP_LTR_SUPP) then R/W else R ■ Dbi: if (pf=0 && DEVICE_CAPABILITIES2_REG.PCIE_CAP_LTR_SUPP) then R/W else R Value After Reset: 0x0 Exists: CX_LTR_M_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead
9	PCIE_CAP_IDO_CPL_EN	R	IDO Completion Enable. If this bit is set, the Function is permitted to set the ID-Based Ordering (IDO) bit (Attr[2]) of Completions it returns (for more details, see section 2.2.6.3 and Section 2.4 of <i>PCI Express Base Specification</i>). Endpoints and Root Ports are permitted to implement this capability. A Function is permitted to hardwire this bit to 0b if it never sets the IDO attribute in Completions. Value After Reset: 0x0 Exists: CX_IDO_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
8	PCIE_CAP_IDO_REQ_EN	R	IDO Request Enable. If this bit is set, the Function is permitted to set the ID-Based Ordering (IDO) bit (Attr[2]) of Requests it initiates (for more details, see section 2.2.6.3 and section 2.4 of <i>PCI Express Base Specification</i>). Endpoints and Root Ports are permitted to implement this capability. A Function is permitted to hardwire this bit to 0b if it never sets the IDO attribute in Requests. Value After Reset: 0x0 Exists: (CX_IDO_ENABLE && CC_DEVICE_TYPE!=3) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
7	PCIE_CAP_ATOMIC_EGRESS_BLOCK	R	AtomicOp Egress Blocking. AtomicOp Egress Blocking. Applicable and mandatory for Switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability; otherwise the controller hardwires this bit to 0b. When this bit is set, AtomicOp Requests that target going out this Egress Port must be blocked. For more information, see section 6.15.2 of <i>PCI Express Base Specification</i>. Reflected on the cfg_atomic_egress_block output. Value After Reset: 0x0 Exists: CX_ATOMIC_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
6	PCIE_CAP_ATOMIC_REQ_EN	R	AtomicOp Requester Enable. Applicable only to Endpoints and Root Ports; the controller hardwires this bit to 0b for other Function types. The Function is allowed to initiate AtomicOp Requests only if this bit and the Bus Master Enable bit in the Command register are both set. This bit is required to be RW if the Endpoint or Root Port is capable of initiating AtomicOp Requests, but otherwise is permitted to be hardwired to 0b. This bit does not serve as a capability bit. This bit is permitted to be RW even if no AtomicOp Requester capabilities are supported by the Endpoint or Root Port. Reflected on the cfg_atomic_req_en output. Value After Reset: 0x0 Exists: CX_ATOMIC_ENABLE && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
5	PCIE_CAP_ARI_FORWARD_SUP PORT_CS	R	ARI Forwarding Enable. When set, the Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. For more information, see Section 6.13 of <i>PCI Express Base Specification</i>. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
4	PCIE_CAP_CPL_TIMEOUT_DISABLE	R	Completion Timeout Disable. When set, this bit disables the Completion Timeout mechanism. This bit is required for all Functions that support the Completion Timeout Disable Capability. Functions that do not support this optional capability are permitted to hardwire this bit to 0b Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding Requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding Requests. If this is done, it is permitted to base the start time for each Request on either the time this bit was cleared or the time each Request was issued. Value After Reset: {(CX_MEMORY_MAP_PCIE_TYPE==1 && !CX_MEMORY_MAP_POSITION) ? 0 : 0} Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
3:0	PCIE_CAP_CPL_TIMEOUT_VALUE	R	Completion Timeout Value. In device Functions that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and controller hardwires it to 0000b. A Function that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50 us to 50 ms. Functions that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Ranges Supported field. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms. Values available if Range A (50 us to 10 ms) programmability range is supported: Values available if Range B (10 ms to 250 ms) programmability range is supported: Values available if Range C (250 ms to 4 s) programmability range is supported: Values available if the Range D (4 s to 64 s) programmability range is supported: Software is permitted to change the value in this field at any time. For Requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding Requests, and is permitted to base the start time for each Request either on when this value was changed or on when each request was issued. Values:
3:0...(cont.)	PCIE_CAP_CPL_TIMEOUT_VALUE. Bits	Name	Memory Access	Description
31	DRS_SUPPORTED	R	DRS Supported. When set, indicates support for the optional Device Readiness Status (DRS) capability. Must be Set in Downstream Ports that support DRS. Must be Set in Downstream Ports that support FRS. For Upstream Ports that support DRS, it is strongly recommended that this bit be Set in Function 0. For all other Functions associated with an Upstream Port, this bit must be Clear.¹²⁷ Must be Clear in Functions that are not associated with a Port. RsvdP in all other Functions. Value After Reset: 0x0 Exists: CX_RN_DRS_SUPPORTED && (CX_MEMORY_MAP_PCIE_TYPE<2) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

24	PCIE_CAP_TWO_RETIMERS_PRE_DET_SUPPORT	R	Two Retimers Presence Detect Supported. When set to 1b, this bit indicates that the associated Port supports detection and reporting of two Retimers presence. This bit must be set to 1b in a Port when the Supported Link Speeds Vector of the Link Capabilities 2 register indicates support for a Link speed of 16.0 GT/s or higher. It is permitted to be set to 1b regardless of the supported Link speeds if the Retimer Presence Detect Supported bit is also set to 1b. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions. Value After Reset: 0x1 Exists: CX_GEN4_SPEED && CX_PL16G_ENABLE && CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true

23	PCIE_CAP_RETIMER_PRE_DET_SUPPORT	R	Retimer Presence Detect Supported. When set to 1b, this bit indicates that the associated Port supports detection and reporting of Retimer presence. This bit must be set to 1b in a Port when the Supported Link Speeds Vector of the Link Capabilities 2 register indicates support for a Link speed of 16.0 GT/s or higher. It is permitted to be set to 1b regardless of the supported Link speeds. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions. 8	PCIE_CAP_CROSS_LINK_SUPPORT	R	Crosslink Supported. When set to 1b, this bit indicates that the associated Port supports crosslinks (for more details, see section 4.2.6.3.1 of <i>PCI Express Base Specification</i>). When set to 0b on a Port that supports Link speeds of 8.0 GT/s or higher, this bit indicates that the associated Port does not support crosslinks. When set to 0b on a Port that only supports Link speeds of 2.5 GT/s or 5.0 GT/s, this bit provides no information regarding the Port's level of crosslink support. It is recommended that this bit be Set in any Port that supports crosslinks even though doing so is only required for Ports that also support operating at 8.0 GT/s or higher Link speeds. Note: Software should use this bit when referencing fields whose definition depends on whether or not the Port supports crosslinks (for more details, see section 7.7.3.4 of <i>PCI Express Base Specification</i>). Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions. Value After Reset: CX_CROSSLINK_ENABLE Exists: CX_MEMORY_MAP_PCIE_TYPE<2 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
7:1	PCIE_CAP_SUPPORT_LINK_SPEED_VECTOR	R	Supported Link Speeds Vector. This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. For more information, see section 8.2.1 of <i>PCI Express Base Specification</i>. Bit definitions within this field are: ■ 0: 2.5 GT/s ■ 1: 5.0 GT/s ■ 2: 8.0 GT/s ■ 3: 16.0 GT/s ■ 4: 32.0 GT/s ■ 6:5 RsvdP Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions. 31	DRS_MESSAGE_RECEIVED	R	DRS Message Received. This bit must be set whenever the Port receives a DRS Message. This bit must be cleared in DL_Down. This bit must be implemented in any Downstream Port where the DRS Supported bit is Set in the Link Capabilities 2 register. This bit is RsvdZ for all other Functions. Value After Reset: 0x0 Exists: (CX_RN_DRS_SUPPORTED && (CX_MEMORY_MAP_PCIE_TYPE<2)) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
30:28	DOWNSTREAM_COMPO_PRESENCE	R	Downstream Component Presence. This field indicates the presence and DRS status for the Downstream Component, if any, connected to the Link. All encodings other than the defined encodings are reserved. Component Presence state must be determined by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism implemented for the Link. If no out-of-band presence detect mechanism is implemented, then Component Presence state must be determined solely by the Physical Layer in-band presence detect mechanism. This field must be implemented in any Downstream Port where the DRS Supported bit is Set in the Link Capabilities 2 register. This field is RsvdZ for all other Functions. Values: ■ 0x0 (LINK_DN_NOT_DETERMINED): Link Down - Presence Not Determined ■ 0x1 (LINK_DN_DSP_NOT_PRESENT): Link Down - Component Not Present indicates the Downstream Port (DP) has determined that a Downstream Component is not present ■ 0x2 (LINK_DN_DLL_NOT_ACTIVE): Link Down - Component Present indicates the DP has determined that a Downstream Component is present, but the Data Link Layer is not active ■ 0x4 (LINK_UP_DRS_NOT_RECEIVED): Link Up - Component Present indicates the DP has determined that a Downstream Component is present, but no DRS Message has been received since the Data Link Layer became active ■ 0x5 (LINK_UP_DRS_RECEIVED): Link Up - Component Present and DRS Received indicates the DP has received a DRS Message since the Data Link Layer became active Value After Reset: 0x0 Exists: (CX_RN_DRS_SUPPORTED && (CX_MEMORY_MAP_PCIE_TYPE<2)) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
25:24	PCIE_CAP_CROSSLINK_RESOLUTION	R	Crosslink Resolution. This field indicates the state of the Crosslink negotiation. It must be implemented if Crosslink Supported is Set and the Port supports 16.0 GT/s or higher data rate. It is permitted to be implemented in all other Ports. If Crosslink Supported is clear, the controller hardwires this field to 01b or 10b. Once a value of 01b or 10b is returned in this field, that value must continue to be returned while the Link is Up. Values: ■ 0x0 (CROSSLINK_RESOLUTION_NOT_SUP): Crosslink Resolution is not supported. No information is provided regarding the status of the Crosslink negotiation. ■ 0x1 (CROSSLINK_NEGOTIATION_RESOLVED_USP): Crosslink negotiation resolved as an Upstream Port. ■ 0x2 (CROSSLINK_NEGOTIATION_RESOLVED_DSP): Crosslink negotiation resolved as a Downstream Port. ■ 0x3 (CROSSLINK_NEGOTIATION_NOT_CMPL): Crosslink negotiation is not completed. Value After Reset: {(CX_CROSSLINK_ENABLE) ? 0x3 : 0x1} Exists: (CX_GEN4_SPEED && CX_MEMORY_MAP_PCIE_TYPE<2) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1 Testable: writeAsRead Volatile: true
23	PCIE_CAP_TWO_RETIMERS_PRE_DET	R	Two Retimers Presence Detected. When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation. For more information, see section 4.2.6.3.5.1 of <i>PCI Express Base Specification</i>. This bit is required for Ports that have the Two Retimers Presence Detect Supported bit of the Link Capabilities 2 register set to 1b. Ports that have the Two Retimers Presence Detect Supported bit set to 0b are permitted to hardwire this bit to 0b. For Multi-Function Devices associated with an Upstream Port, this bit must be implemented in Function 0 and RsvdZ in all other Functions. <i>Note:</i> This register field is sticky. 16	PCIE_CAP_CURR_DEEMPHASIS	R	Current De-emphasis Level. When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. For components that support speeds greater than 2.5 GT/s, Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions of the Port. In C-PCIe mode, its contents are derived by sampling the PIPE. 15:12	PCIE_CAP_COMPLIANCE_PRES ET	R	Compliance Preset/De-emphasis. ■ For 8.0 GT/s and higher Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The encodings are defined in section 4.2.3.2 of <i>PCI Express Base Specification</i> . Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. ■ For 5.0 GT/s Data Rate: This field sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. ■ When the Link is operating at 2.5 GT/s, the setting of this field has no effect. Components that support only 2.5 GT/s speed are permitted to hardwire this field to 0000b. ■ For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. ■ This field is intended for debug and compliance testing purposes. System firmware and software is allowed to modify this field only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value. Note: This register field is sticky. 11	PCIE_CAP_COMPLIANCE_SOS	R	Compliance SOS. When set to 1b, the LTSSM is required to send SKP Ordered Sets between sequences when sending the Compliance Pattern or Modified Compliance Pattern. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only. For components that support only the 2.5 GT/s speed, the controller hardwires this bit to 0b. <i>Note:</i> This register field is sticky. 9:7	PCIE_CAP_TX_MARGIN	R/W	Transmit Margin, This field controls the value of the non-deemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see Chapter 4 of <i>PCI Express Base Specification</i> for details of how the Transmitter voltage level is determined in various states). 001b-111b: As defined in Section 8.3.4 not all encodings are required to be implemented. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. For components that support only the 2.5 GT/s speed, the controller hardwires this bit to 000b. This field is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this field only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value. <i>Note:</i> This register field is sticky. 6	PCIE_CAP_SEL_DEEMPHASIS	R	Selectable De-emphasis. When the Link is operating at 5.0 GT/s speed, this bit is used to control the transmit de-emphasis of the link in specific situations. For more information, see section 4.2.6 of <i>PCI Express Base Specification</i>. When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. <i>Note:</i> This register field is sticky. 5	PCIE_CAP_HW_AUTO_SPEED_DISABLE	R	Hardware Autonomous Speed Disable. When set, this bit disables hardware from changing the Link speed for device-specific reasons other than attempting to correct unreliable Link operation by reducing Link speed. Initial transition to the highest supported common link speed is not blocked by this bit. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_GEN2_SPEED && (CX_MEMORY_MAP_PCIE_TYPE<2)) && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

4	PCIE_CAP_ENTER_COMPLIANCE	* Varies	Enter Compliance. Software is permitted to force a Link to enter Compliance mode (at the speed indicated in the Target Link Speed field and the de-emphasis/preset level indicated by the Compliance Preset/De-emphasis field) by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. Bits	Name	Memory Access	Description
3:0	PCIE_CAP_TARGET_LINK_SPEED	R	Target Link Speed. For Downstream Ports, this field sets an upper limit on Link operational speed by restricting the values advertised by the Upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All encodings other than the defined encodings are reserved. If a value is written to this field that does not correspond to a supported speed (as indicated by the Supported Link Speeds Vector), the result is undefined. If either of the Enter Compliance or Enter Modified Compliance bits are implemented, then this field must also be implemented. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. For Upstream Ports, if the Enter Compliance bit is Clear, this field is permitted to have no effect. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this field to 0000b. <i>Note:</i> This register field is sticky. Values:

Bits	Name	Memory Access	Description
31	PCI_MSIX_ENABLE	R	MSI-X Enable. If Set and the MSI Enable bit in the MSI Message Control Register for MSI is Clear, the Function is permitted to use MSI-X to request service and is prohibited from using INTx interrupts (if implemented). System configuration software Sets this bit to enable MSI-X. A device driver is prohibited from writing this bit to mask a Function's service request. If Clear, the Function is prohibited from using MSI-X to request service. Bits	Name	Memory Access	Description
30	PCI_MSIX_FUNCTION_MASK	* Varies	Function Mask. If Set, all of the vectors associated with the Function are masked, regardless of their per-vector Mask bit values. If Clear, each vector's Mask bit determines whether the vector is masked or not. Setting or Clearing the MSI-X Function Mask bit has no effect on the value of the per-vector Mask bits. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_MSIX_CAP_ENABLE EXT_VF_MSIX_CAP_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0 && VF_MSIX_CAP_ENABLE) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !VF_MSIX_CAP_ENABLE) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1 && VF_MSIX_CAP_ENABLE) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !VF_MSIX_CAP_ENABLE) ? \"read-only\" : \"read-only\""

Bits	Name	Memory Access	Description
26:16	PCI_MSIX_TABLE_SIZE	* Varies	MSI-X Table Size. System software reads this field to determine the MSI-X Table Size N, which is encoded as N-1. For example, a returned value of 000 0000 0011b indicates a table size of 4. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table Size" (PCI_MSIX_TABLE_SIZE field in SHADOW_PCI_MSIX_CAP_ID_NEXT_CTRL_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_TABLE_SIZE field in the PF PCI_MSIX_CAP_ID_NEXT_CTRL_REG register. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R ■ Dbi2: R (sticky) and more specifically: (CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN && MSIX_CAP_ENABLE) ? The lower 3 PBA BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA Offset" (PCI_MSIX_PBA_OFFSET field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_OFFSET field in the PF MSIX_PBA_OFFSET_REG register. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R ■ Dbi2: R (sticky) and more specifically: (CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN && MSIX_CAP_ENABLE) ? R/W : (CX_MEMORY_MAP_VIEW==0) ? R: (CX_MEMORY_MAP_VIEW==1) ? R: (MSIX_CAP_ENABLE && CX_DBI_RO_WR_EN) ? R/W : R <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
2:0	PCI_MSIX_PBA_BIR	* Varies	MSI-X PBA BIR. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI, is used to map the Function's MSI-X PBA into Memory Space. The PBA BIR value definitions are identical to those for the Table BIR . SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA BIR" (PCI_MSIX_PBA_BIR field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_BIR field in the PF MSIX_PBA_OFFSET_REG register. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R ■ Dbi2: R (sticky) and more specifically: (CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN && MSIX_CAP_ENABLE) ? 3.54 VF_PF_AER_CAPi Registers

3.54.1 VF_AER_EXT_CAP_HDR_OFF

- **Name:** Advanced Error Reporting Extended Capability Header.
- **Description:** Advanced Error Reporting Extended Capability Header provides information about Capability ID, Version, and next offset.
- **Size:** 32 bits
- **Offset:** B+0x0
- **Exists:** ((VF_AER_ENABLE | | EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

NEXT_OFFSET	CAP_VERSION	CAP_ID

Table 3-509 Fields for Register: VF_AER_EXT_CAP_HDR_OFF

Bits	Name	Memory Access	Description
31:20	NEXT_OFFSET	* Varies	Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: Pointer value calculated at configuration time. Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_AER_ENABLE EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: wire ? unconstrained : writeAsRead

Bits	Name	Memory Access	Description
19:16	CAP_VERSION	* Varies	Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field must be 2h if the End-End TLP Prefix Supported bit is set and must be 1h or 2h otherwise. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x2 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_AER_ENABLE EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: wire ? unconstrained : writeAsRead
15:0	CAP_ID	* Varies	AER Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Advanced Error Reporting Capability is 0001h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_AER_ENABLE EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: wire ? unconstrained : writeAsRead

3.54.2 VF_UNCORR_ERR_STATUS_OFF

- **Name:** Uncorrectable Error Status Register.
- **Description:** The Uncorrectable Error Status Register (Offset 04h) indicates error detection status of individual errors on a PCI Express device Function. An individual error status bit that is Set indicates that a particular error was detected; software may clear an error status by writing a 1b to the respective bit. Register bits not implemented by the Function are hardwired to 0b.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** ((VF_AER_ENABLE | | EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

22	INTERNAL_ERR_STATUS	R/W1C	Uncorrectable Internal Error Status. This field gives status of the Uncorrectable Internal Error. The controller sets this bit when your application asserts app_err_bus[9]. It does not set this bit when it detects internal uncorrectable internal errors such as parity and ECC failures. You should use the outputs from these errors to drive the app_err_bus[9] input. For more information, see the "Data Integrity (Wire, Datapath, and RAM Protection)" section in the <i>Databook</i>. 3.54.3 VF_UNCORR_ERR_MASK_OFF

- **Name:** Uncorrectable Error Mask Register.
- **Description:** The Uncorrectable Error Mask Register controls reporting of individual errors by the device Function to the PCI Express Root Complex through a PCI Express error Message. A masked error (respective bit Set in the mask register) is not recorded or reported in the Header Log, TLP Prefix Log, or First Error Pointer, and is not reported to the PCI Express Root Complex by this Function. There is a mask bit per error bit of the Uncorrectable Error Status register. Register fields for bits not implemented by the Function are hardwired to 0b.
- **Size:** 32 bits
- **Offset:** B+0x8
- **Exists:** ((VF_AER_ENABLE | | EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

3.54.5 VF_CORR_ERR_STATUS_OFF

- **Name:** Correctable Error Status Register.
- **Description:** The Correctable Error Status register reports error status of individual correctable error sources on a PCI Express device Function. When an individual error status bit is Set, it indicates that a particular error occurred; software may clear an error status by writing a 1b to the respective bit. Register bits not implemented by the Function are hardwired to 0b by the controller.
- **Size:** 32 bits
- **Offset:** B+0x10
- **Exists:** ((VF_AER_ENABLE | | EXT_VF_AER_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

3.54.6 VF_CORR_ERR_MASK_OFF

- **Name:** Correctable Error Mask Register.
- **Description:** The Correctable Error Mask Register controls reporting of individual correctable errors by this Function to the PCI Express Root Complex through a PCI Express error Message. A masked error (respective bit Set in the mask register) is not reported to the PCI Express Root Complex by this Function. There is a mask bit per error bit in the Correctable Error Status register. Register fields for bits not implemented by the Function are hardwired to 0b by the controller.

3.54.12 VF_TLP_PREFIX_LOG_i_OFF (for i = 1; i <= 4)

- **Name:** TLP Prefix Log Register 1.
- **Description:** The First TLP Prefix Log Register contains the first End-End TLP Prefix from the TLP corresponding to the detected error. The TLP Prefix Log Register is only meaningful when the TLP Prefix Log Present bit is Set. The TLP Prefixes are captured such that, when read using DW accesses, the fields of the TLP Prefix are laid out in the same way the fields of the TLP Prefix are described. Therefore, byte 0 of a TLP Prefix is located in byte 3 of the associated TLP Prefix Log Register; byte 1 of a TLP Prefix is located in byte 2; and so forth. The TLP Prefix Log Registers beyond the number supported by the Function are hardwired to zero by controller. 17	ARI_ACS_FUN_GRP_EN	R	ACS Function Groups Enable. Applicable only for Function 0; must be hardwired to 0b for all other Functions. When set, each Function in the ARI Device must associate bits within its Egress Control Vector with Function Group Numbers rather than Function Numbers. Must be hardwired to 0b if the ACS Function Groups Capability bit is 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1
16	ARI_MFVC_FUN_GRP_EN	R	MFVC Function Groups Enable. Applicable only for Function 0; must be hardwired to 0b for all other Functions. When set, the ARI Device must interpret entries in its Function Arbitration Table as Function Group Numbers rather than Function Numbers. Must be hardwired to 0b by the controller if the MFVC Function Groups Capability bit is 0b. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Bits	Name	Memory Access	Description
15:8	ARI_NEXT_FUN_NUM	R	Next Function Number. This field indicates the Function Number of the next higher numbered Function in the Device, or 00h if there are no higher numbered Functions. Function 0 starts this linked list of Functions. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1

Table 3-524 Fields for Register: VF_ACS_CAPABILITIES_CTRL_REG

Bits	Name	Memory Access	Description
31:23	RSVDP_23	R	Reserved for future use. Reserved Field: Yes Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1)

Bits	Name	Memory Access	Description
22	ACS_DIRECT_TRANSLATED_P2P_EN	R/W	ACS Direct Translated Peer-to-Peer Enable. When Set, overrides the ACS_P2P_REQ_REDIRECT and ACS_P2P_EGRESS_CONTROL mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address. This bit is ignored if ACS_AT_BLOCK_EN is 1b. The controller hardwires this bit to 0b if, the ACS Direct Translated P2P functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
21	ACS_P2P_EGRESS_CONTROL_EN	R/W	ACS Peer-to-Peer Egress Control Enable. In conjunction with the Egress Control Vector plus the ACS_P2P_REQ_REDIRECT and ACS_DIRECT_TRANSLATED_P2P mechanisms, determines when to allow, disallow, or redirect peer-to-peer Requests. The controller hardwires this bit to 0b if, the ACS P2P Egress Control functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
20	ACS_USP_FORWARDING_EN	R/W	ACS Upstream Forwarding Enable. When Set, the component forwards Upstream any Request or Completion TLPs it receives that were redirected Upstream by a component lower in the hierarchy. This bit only applies to Upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. The controller hardwires this bit to 0b if, the ACS Upstream Forwarding functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
19	ACS_P2P_CPL_REDIRECT_EN	R/W	ACS Peer-to-Peer Completion Redirect Enable. Determines when the component redirects peer-to-peer Completions Upstream; applicable only to Completions whose Relaxed Ordering Attribute is clear. The controller hardwires this bit to 0b if, the ACS P2P Completion Redirect functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
18	ACS_P2P_REQ_REDIRECT_EN	R/W	ACS Peer-to-Peer Request Redirect Enable. In conjunction with ACS_P2P_EGRESS_CONTROL and ACS_DIRECT_TRANSLATED_P2P mechanisms, determines when the component redirects peer-to-peer Requests Upstream. With Downstream Ports, this bit only applies to Upstream Requests arriving at the Downstream Port, and whose normal routing targets a different Downstream Port. The controller hardwires this bit to 0b if, the ACS P2P Request Redirect functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
17	ACS_AT_BLOCK_EN	R/W	ACS Translation Blocking Enable. When Set, the component blocks all Upstream Memory Requests whose Address Translation (AT) field is not set to the default value. The controller hardwires this bit to 0b if, the ACS Translation Blocking functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true
16	ACS_SRC_VALID_EN	R/W	ACS Source Validation Enable. When Set, the component validates the Bus Number from the Requester ID of Upstream Requests against the secondary/subordinate Bus Numbers. The controller hardwires this bit to 0b if, the ACS Source Validation functionality is not implemented. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
15:8	ACS_EGRESS_CTRL_SIZE	* Varies	ACS Egress control vector size. Encodings 01h-FFh directly indicate the number of applicable bits in the Egress Control Vector; the encoding 00h indicates 256 bits. If the ACS_P2P_EGRESS_CONTROL bit is 0b, the value of the size field is undefined, and the Egress Control Vector register is not required to be present. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: CX_ACS_EGRESS_CTRL_SIZE_0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0 && CX_DBI_RO_WR_EN) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==0 && !CX_DBI_RO_WR_EN) ? \"read-only\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-only\""

3.56.3 VF_ACS_EGRESS_CTRL_VECTOR_REGi (for i = 0; i <= 7)

- **Name:** Access Control Services Egress Control Vector Register #i
- **Description:** This Egress Control Vector register is a read-write register that contains a bit-array. The number of bits in the register is specified by the ACS_EGRESS_CTRL_SIZE field, and the register spans multiple DWORDs, if required.
- **Size:** 32 bits
- **Offset:** B+0x8 + i*0x4
- **Exists:** (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1)

Bits	Name	Memory Access	Description
31:0	ACS_EGRESS_CTRL_VECTOR_REG0	* Varies	Access Control Services Egress Control Vector Register #i. An N-bit bit-array configured by software, where N is given by the value in the ACS_EGRESS_CTRL_SIZE field. When a given bit is set, peer-to-peer Requests targeting the associated Port, Function, or Function Group are blocked or redirected (if enabled). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (ACS_CTRL_VEC_WD_0>0) && CX_ACS_P2P_EGRESS_CTRL_0==1 && (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && (VF_ACS_ENABLE && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-write\" : \"read-only\""

3.57 VF_PF_ATS_CAPi Registers

3.57.1 VF_ATS_CAP_HDR_REG

- **Name:** ATS Extended Capability Header.
- **Description:** This register provides value of Capability ID, Capability version, and next offset of Extended capability structure.

3.57.2 VF_ATS_CAPABILITIES_CTRL_REG

- **Name:** ATS Requester Capability Register.
- **Description:** This register provides value of Invalidate queue depth, Page alignment request, and Global Invalidate support. It also controls Cache translation and Smallest Translate Unit.
- **Size:** 32 bits
- **Offset:** B+0x4
- **Exists:** ((VF_ATS_ENABLE | | EXT_VF_ATS_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

Values: ■ 0x1 (SET): The Function supports Invalidation Requests that have the Global Invalidate bit Set. ■ 0x0 (CLEAR): The Function ignores the Global Invalidate bit in all Invalidate Requests. This bit is 0b if the Function does not support the PASID TLP Prefix. Value After Reset: DEFAULT_ATS_GLOBAL_INVALID_SPPRTD Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_ATS_ENABLE EXT_VF_ATS_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
5	PAGE_ALIGNED_REQ	* Varies	Page Aligned Request. If Set, indicates the Untranslated Address is always aligned to a 4096 byte boundary. Setting this field is recommended. This field permits software to distinguish between implementations compatible with this specification and those compatible with an earlier version of this specification in which a Requester was permitted to supply anything in bits [11:2]. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Value After Reset: 0x1 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_ATS_ENABLE EXT_VF_ATS_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1) Testable: {(CX_EXTENSIBLE_VFUNC) ? "untestable" : "unconstrained" }
4:0	INVALIDATE_Q_DEPTH	R	Invalidate Queue Depth. The number of Invalidate Requests that the Function can accept before putting backpressure on the Upstream connection. If 0 0000b, the Function can accept 32 Invalidate Requests. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_MAX_VF_0>0) && CX_SRIOV_ENABLE && ((VF_ATS_ENABLE EXT_VF_ATS_ENABLE) && CX_MEMORY_MAP_PCIE_TYPE!=1)

3.58 VF_PF_LNR_CAPi Registers

3.58.1 VF_LNR_EXT_CAP_HDR_OFF

- **Name:** LNR Extended Capability Header.
- **Description:** This register provides Capability ID, Capability version, and Next offset of Extended Capability Structure.

15:0	RTR_EXT_CAP_ID

Table 3-532 Fields for Register: VF_RTR_EXT_CAP_HDR_OFF

Bits	Name	Memory Access	Description
31:20	RTR_NEXT_OFFSET	* Varies	Next Capability Offset. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for the Readiness Time Reporting Extended Capability is 0022h. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
26:16	TPH_REQ_CAP_ST_TABLE_SIZE	R	ST Table Size. This field indicates the maximum number of ST Table entries the Function may use. Software reads this field to determine the ST Table Size N, which is encoded as N-1. For example, a returned value of 000 0000 0011b indicates a table size of four entries. There is an upper limit of 64 entries when the ST Table is located in the TPH Requester Extended Capability structure. When the ST Table is located in the MSI-X Table, this value is limited by the size of the MSI-X Table. This field is only applicable for Functions that implement an ST Table as indicated by the ST Table Location field. Otherwise, the value in this field is undefined. <i>Note:</i> This register field is sticky. Table 3-578 Fields for Register: IATU_REGION_CTRL_1_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
x:20	CTRL_1_FUNC_NUM	R/W	Function Number. When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Region Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. The value in this register must be 0x0 unless multifunction operation in the controller is enabled (CX_NFUNC > 1). When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0) Range Variable[x]: (CX_NFUNC_WD) + 19
19:18	PH	R/W	When the address of an outbound TLP is matched to this region, then the PH field of the TLP is changed to the value in this register. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Table 3-579 Fields for Register: IATU_REGION_CTRL_2_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
31	REGION_EN	R/W	Region Enable. This bit must be set to '1' for address translation to take place. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
30			Reserved Field: Yes

Bits	Name	Memory Access	Description
29	INVERT_MODE	R/W	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
28	CFG_SHIFT_MODE	R/W	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
27	DMA_BYPASS	R/W	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. <i>Note:</i> This field is reserved for the SW product. You must set it to '0'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_DEVICE_TYPE!=3 && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
26:24			Reserved Field: Yes
23	HEADER_SUBSTITUTE_EN	R/W	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. Encodings are as above. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (FILL_BYTES): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. ■ 0x0 (FORM_ADDR): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
22	INHIBIT_PAYLOAD	R/W	Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. Encoding are define as above. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (NO_SUPPORT_FOR_DATA_TLP): Fmt[1] =0 so that only TLP type without data is sent. For example, a MsgD instead of MsgD will be sent. ■ 0x0 (SUPPORT_DATA_TLP): Fmt[1] =0/1 so that TLPs with or without data can be sent. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
21	TLP_HEADER_FIELDS_BYPASS	R/W	TLP Header Fields Translation Bypass. In this mode header fields of the translated TLP is taken from your application transmit interface or, if AMBA is configured, from the AMBA sideband bus (slv_awmisc_info) and not from the corresponding fields of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i or IATU_REGION_CTRL_2_OFF_OUTBOUND_i registers. The header fields are ■ TC ■ PH ■ TH ■ ST ■ AT ■ Attr (IDO, RO and NS). <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
20	SNP	R/W	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: AXI_POPULATED && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
19	FUNC_BYPASS	R/W	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Region Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
18:17	MSB2BITS_TAG	R/W	Not used. Reserved for future use. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_10BITS_TAG && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
16	TAG_SUBSTITUTE_EN	R/W	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. <i>Note (CX_TPH_ENABLE=1):</i> TAG substitution for MWr will not occur because this field (byte 6) in the TLP header is the ST field. ST substitution can still take place using the MSG_CODE field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i. <i>Note (CX_10BIT_TAG =1):</i> For 10-bit tags, TAG substitution only applies to the 8 least significant bits of the TAG field (bits 7:0 of Byte 4 of the TLP Header). T9 and T8 of the Header are not substituted. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)
15:8	TAG	R/W	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
7:0	MSG_CODE	R/W	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST: Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

3.66.3 IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Lower Base Address Register.
- **Description:** The CX_ATU_MIN_REGION_SIZE configuration parameter (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ bits are zero.
- **Size:** 32 bits
- **Offset:** $B+i*2*0x100+0x8$
- **Exists:** $(\text{CX_INTERNAL_ATU_ENABLE} \&\& \text{CC_UNROLL_ENABLE} \&\& (\text{CX_MEMORY_MAP_PCIE_TYPE}==0 \mid \mid \text{CX_MEMORY_MAP_PCIE_TYPE}==1)) \&\& (\text{CX_ATU_NUM_OUTBOUND_REGIONS}>0)$

x:0	LWR_BASE_HW

Table 3-580 Fields for Register: IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
x:y	LWR_BASE_RW	R/W	Forms bits [31:n] of the start address of the address region to be translated. n is $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: $(\text{CX_INTERNAL_ATU_ENABLE} \&\& \text{CC_UNROLL_ENABLE} \&\& (\text{CX_MEMORY_MAP_PCIE_TYPE}==0 \mid \mid \text{CX_MEMORY_MAP_PCIE_TYPE}==1)) \&\& (\text{CX_ATU_NUM_OUTBOUND_REGIONS}>0)$ Range Variable[x]: $32 - (\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)) + \log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2) - 1$ Range Variable[y]: $\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)$

Bits	Name	Memory Access	Description
x:0	LWR_BASE_HW	R	Forms bits [$n-1:0$] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0) Range Variable[x]: $\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)$ - 1

3.66.4 IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Upper Base Address Register.
- **Description:** This register holds the upper 32-bits of the start (and end) address of the address region to be translated.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0xc
- **Exists:** (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

3.66.5 IATU_LIMIT_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Limit Address Register.
- **Description:** This register holds the end address of the address region to be translated.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x10
- **Exists:** (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

3.66.6 IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Lower Target Address Register.
- **Description:** This register holds the Lower Target part of the new address of the translated region, or the outbound TLP header information, depending on the setting of HEADER_SUBSTITUTE_EN field of IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i register.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x14
- **Exists:** (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Table 3-583 Fields for Register: IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
31:0	LWR_TARGET_RW_OUTBOUND	R/W	When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_ is '0' (normal operation): ■ LWR_TARGET_RW[31:n] forms MSB's of the Lower Target part of the new address of the translated region; ■ LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). ■ n is log2(CX_ATU_MIN_REGION_SIZE). When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_i is '1': ■ LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

3.66.7 IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Upper Target Address Register.
- **Description:** This register holds the upper 32 bits of the start address (Upper Target part) of the new address of the translated region.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x18

x:0	VF_NUMBER	R/W	Virtual Function Number. When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Region Control 2 Register" is '0', then this field used in generating the Function part of the requester ID (RID) field of the TLP. Indicates from which virtual function (VF) the request is mapped. The iATU uses this signal to form the requester ID. The PCIe SR-IOV specification starts numbering VFs at 1. To ease timing during synthesis, the PCIe controller starts numbering VFs at 0. For example, a value of '0' here refers to the first VF, of the PF that is identified by the CTRL_1_FUNC_NUM field in the "iATU Control 1 Register" For more information, see "RID BDF Number Replacement." The VF_ACTIVE bit must be set to '1'. <i>Note:</i> This register field is sticky. 3.66.9 IATU_UPPR_LIMIT_ADDR_OFF_OUTBOUND_i (for i = 0; i <= CX_ATU_NUM_OUTBOUND_REGIONS-1)

- **Name:** iATU Upper Limit Address Register.
- **Description:** The CX_MAX_ATU_REGION_SIZE configuration parameter (Value Range: 0->32, 8=1TB) specifies the maximum region size of an address translation region. This register is only used when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1'.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x20
- **Exists:** (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_OUTBOUND_REGIONS>0)

Table 3-587 Fields for Register: IATU_REGION_CTRL_1_OFF_INBOUND_i (for i = 0; i <= CX_ATU_NUM_INBOUND_REGIONS-1)

Bits	Name	Memory Access	Description
x:20	CTRL_1_FUNC_NUM	R/W	Function Number. MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0) Range Variable[x]: (CX_NFUNC_WD) + 19
19:18	PH	R/W	When the PH field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "PH Match Enable" bit of the "iATU Region Control 2 Register" is set. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_TPH_ENABLE && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
17:16	AT	R/W	When the AT field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "AT Match Enable" bit of the "iATU Region Control 2 Register" is set. Only valid when the ATS_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. 15:14			Reserved Field: Yes
13	INCREASE_REGION_SIZE	R/W	Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE ■ 0x0 (DISABLE): Maximum ATU Region size is 4 GB (default) Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
12	TH	R/W	When the TH field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "TH Match Enable" bit of the "iATU Region Control 2 Register" is set. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: CX_TPH_ENABLE && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
11	IDO	R/W	When the IDO field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Region Control 2 Register" is set. Only Valid when the CX_IDO_ENABLE configuration parameter is set to '1'. <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
31	REGION_EN	R/W	Region Enable. This bit must be set to '1' for address translation to take place. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
30	MATCH_MODE	R/W	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM I/O TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. ■ 1: BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: ■ 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. ■ 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers.

Bits	Name	Memory Access	Description
30...(cont.)	MATCH_MODE.	R/W	1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored. <i>Note:</i> This register field is sticky. Values: 0x0 (ZERO): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. 0x1 (ONE): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
29	INVERT_MODE	R/W	Invert Mode Enable. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). When set all regions of that type must use address match mode. <i>Note:</i> This register field is sticky. Values: 0x1 (ENABLE): Invert Mode Enable 0x0 (DISABLE): Invert Mode Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
28	CFG_SHIFT_MODE	R/W	CFG Shift Enable. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): CFG Shift Enable ■ 0x0 (DISABLE): CFG Shift Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
27	FUZZY_TYPE_MATCH_CODE	R/W	Fuzzy Type Match Enable. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that ■ CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. ■ MWr, MRd, and MRdLk TLPs are seen as identical ■ The Routing field of Msg/MsgD TLPs is ignored ■ FetchAdd, Swap, and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Region Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Fuzzy Type Match Enable ■ 0x0 (DISABLE): Fuzzy Type Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
26	VFBAR_MATCH_MODE_EN	R/W	VF BAR Match Enable. When set, Virtual Function BAR matching is used which allows all VFs in a PF which match a BAR to be matched with a single ATU region. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Virtual Function BAR Match Enable ■ 0x0 (DISABLE): Virtual Function BAR Match Disable Value After Reset: 0x0 Exists: CX_SRIOV_ENABLE && CC_DEVICE_TYPE!=3 && CC_DEVICE_TYPE!=1 && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
25:24	RESPONSE_CODE	R/W	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (NORMAL_RADM): Normal RADM filter response is used. ■ 0x1 (UNSUP_REQ): Unsupported request (UR) ■ 0x2 (COMPL_ABORT): Completer abort (CA) ■ 0x3 (NOT_USED): Not used / undefined / reserved Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
23	SINGLE_ADDR_LOC_TRANS_EN	R/W	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
22	PH_MATCH_EN	R/W	PH Match Enable. Ensures that a successful PH TLP field comparison match (see PH field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): PH Match Enable ■ 0x0 (DISABLE): PH Match Disable Value After Reset: 0x0 Exists: CX_TPH_ENABLE && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
21	MSG_CODE_MATCH_EN	R/W	Message Code Match Enable (Msg TLPs). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Region Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Region Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Message Code Match Enable (for Msg TLPs) or ST Match Enable (for Mem TLPs) ■ 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
20	VF_MATCH_EN	R/W	Virtual Function Number Match Enable. Ensures that a successful Virtual Function Number TLP field comparison match (see Virtual Function Number field of the "iATU Control 3 Register") occurs (in MEM-I/O transactions) for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Virtual Function Number Match Enable ■ 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0 Exists: CX_SRIOV_ENABLE && CC_DEVICE_TYPE!=3 && CC_DEVICE_TYPE!=1 && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
19	FUNC_NUM_MATCH_EN	R/W	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Region Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Function Number Match Enable ■ 0x0 (DISABLE): Function Number Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
18	AT_MATCH_EN	R/W	AT Match Enable. Ensures that a successful AT TLP field comparison match (see AT field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only valid when the ATS_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): AT Match Enable ■ 0x0 (DISABLE): AT Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && ATS_RX_ENABLE && CC_UNROLL_ENABLE && CC_DEVICE_TYPE!=3) && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
17	TH_MATCH_EN	R/W	TH Match Enable. Ensures that a successful TH TLP field comparison match (see TH field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): TH Match Enable ■ 0x0 (DISABLE): TH Match Disable Value After Reset: 0x0 Exists: CX_TPH_ENABLE && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
16	ATTR_MATCH_EN	R/W	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): ATTR Match Enable ■ 0x0 (DISABLE): ATTR Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
15	TD_MATCH_EN	R/W	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): TD Match Enable ■ 0x0 (DISABLE): TD Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

Bits	Name	Memory Access	Description
14	TC_MATCH_EN	R/W	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Region Control 1 Register") occurs for address translation to proceed. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): TC Match Enable ■ 0x0 (DISABLE): TC Match Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
13	MSG_TYPE_MATCH_MODE	R/W	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the IATU_REGION_CTRL_1_VIEWPORT_OFF_INBOUND_i register (TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. <i>Note:</i> This register field is sticky. Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
12:11			Reserved Field: Yes

Bits	Name	Memory Access	Description
10:8	BAR_NUM	R/W	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Region Control 2 Register" is set. IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. <i>Note:</i> This register field is sticky. Values: ■ 0x0 (BAR0): BAR0 ■ 0x1 (BAR1): BAR1 ■ 0x2 (BAR2): BAR2 ■ 0x3 (BAR3): BAR3 ■ 0x4 (BAR4): BAR4 ■ 0x5 (BAR5): BAR5 ■ 0x6 (ROM): ROM ■ 0x7 (RSVD): reserved Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)
7:0	MSG_CODE	R/W	MSG TLPs: (Message Code). When the MSG_CODE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Region Control 2 Register" is set and the TYPE field of the inbound TLP is Msg/MsgD. Memory TLPs: (ST: Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Region Control 2 Register" is set. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

3.66.12 IATU_LWR_BASE_ADDR_OFF_INBOUND_i (for i = 0; i <= CX_ATU_NUM_INBOUND_REGIONS-1)

- **Name:** iATU Lower Base Address Register.
- **Description:** The CX_ATU_MIN_REGION_SIZE configuration parameter (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ bits are zero.
- **Size:** 32 bits
- **Offset:** $B+i*2*0x100+0x8+0x100$
- **Exists:** $(\text{CX_INTERNAL_ATU_ENABLE} \&\& \text{CC_UNROLL_ENABLE} \&\& (\text{CX_MEMORY_MAP_PCIE_TYPE}==0 \mid \mid \text{CX_MEMORY_MAP_PCIE_TYPE}==1)) \&\& (\text{CX_ATU_NUM_INBOUND_REGIONS}>0)$

Bits	Name	Memory Access	Description
x:y	LWR_BASE_RW	R/W	Forms bits [31:n] of the start address of the address region to be translated. n is $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: $(\text{CX_INTERNAL_ATU_ENABLE} \&\& \text{CC_UNROLL_ENABLE} \&\& (\text{CX_MEMORY_MAP_PCIE_TYPE}==0 \mid \mid \text{CX_MEMORY_MAP_PCIE_TYPE}==1)) \&\& (\text{CX_ATU_NUM_INBOUND_REGIONS}>0)$ Range Variable[x]: $32 - (\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)) + \log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2) - 1$ Range Variable[y]: $\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)$

Bits	Name	Memory Access	Description
x:0	LWR_BASE_HW	R	Forms bits [$n-1:0$] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is $\log_2(\text{CX_ATU_MIN_REGION_SIZE})$ Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0) Range Variable[x]: $\log(\text{CX_ATU_MIN_REGION_SIZE})/\log(2)$ - 1

Bits	Name	Memory Access	Description
3:0	CBUF_INCR	* Varies	Circular Buffer Increment. When CX_ATU_SLOC_CBUF = 0, then this field is Read-only and forms the lowest bits of the end address of the address region to be translated. When CX_ATU_SLOC_CBUF = 1, then this field is R/W and forms the upper bits of the Circular Buffer Increment size (CBUF_INCR) field for Single Location Address translation. The increment value (in bytes) is decoded as follows: Note: A write to any bit in the CBUF_INCR field resets the circular buffer pointer - that is, the next matched received Message will be translated to the start address of the Circular Buffer. This field must be written to AFTER the target and limit registers have been updated. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R (sticky) ■ Dbi: R (sticky) <i>Note:</i> This register field is sticky. Bits	Name	Memory Access	Description
31:0	UPPER_TARGET_RW	R/W	Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. <i>Note:</i> This register field is sticky. Value After Reset: 0x0 Exists: (CX_INTERNAL_ATU_ENABLE && CC_IN64 && CC_UNROLL_ENABLE) && (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

3.66.17 IATU_REGION_CTRL_3_OFF_INBOUND_i (for i = 0; i <= CX_ATU_NUM_INBOUND_REGIONS-1)

- **Name:** iATU Region Control 3 Register.
- **Description:** This register holds the virtual function number used for iATU inbound region matching (wherever applicable).
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x1c+0x100
- **Exists:** (CX_INTERNAL_ATU_ENABLE && CC_UNROLL_ENABLE && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CX_ATU_NUM_INBOUND_REGIONS>0)

3.67 PF0_DMA_CAP Registers

3.67.1 DMA_CTRL_DATA_ARB_PRIOR_OFF

- **Name:** DMA Arbitration Scheme for TRGT1 Interface.
 - **Description:** This register is used to control traffic priorities among various sources that are delivered to your application through TRGT1 where 0x0 represents the highest priority.
 - Non-DMA Rx Requests
 - DMA Write Channel MRd Requests (DMA data requests and LL element/descriptor access)
 - DMA Read Channel MRd Requests (LL element/descriptor access)
 - DMA Read Channel MWr Requests
- Concurrent traffic from channels with same priority are sorted according to Round-Robin arbitration rules. The arbitration priority defaults to Non-DMA requests (highest), Write Channel MRd, Read Channel MRd, Read Channel MWr. For more information, see the "Internal Architecture" section in the DMA chapter of the *Databook*.

Bits	Name	Memory Access	Description
0	DMA_WRITE_ENGINE	* Varies	DMA Write Engine Enable. For normal operation, you must initially set this bit to '1', before any other software setup action. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to '0' when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: ■ The "Abort Interrupt Status" bit is set in the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF), and any of the bits in the DMA Write Error Status Register (DMA_WRITE_ERR_STATUS_OFF) are set. Resetting the DMA controller write logic re-initializes the control logic, ensuring that the next DMA write transfer is executed successfully. ■ You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the Channel Status(CS) field of the DMA Write Channel Control 1 Register (DMA_CH_CTRL1_OFF_WRCH_i) is set to "Stopped". Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. ■ During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: ■ De-assert the DMA write engine enable bit. ■ Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a '0'.

Bits	Name	Memory Access	Description
0...(cont .)	DMA_WRITE_ENGINE.	* Varies	■ Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable (Soft Reset) Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: untestable Volatile: true Memory Access:

2:0	WR_DOORBELL_NUM

Table 3-599 Fields for Register: DMA_WRITE_DOORBELL_OFF

Bits	Name	Memory Access	Description
31	WR_STOP	* Varies	Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Write Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
2:0	WR_DOORBELL_NUM	* Varies	Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, where 0x0 corresponds to channel 0. <i>Note:</i> A write to this field triggers the controller to exit L1 substates. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

9:0	DMA_WRITE_ENGINE_MAX_PREFETCH	R/W	This field controls the linked list prefetch allocation space for each of the HDMA write engine channels. Each channel will be able to store as many linked list elements as specified here. Therefore this field must be within the following range: [0 : floor(CX_DMA_WR_LLQ * CC_NUM_DMA_WR_CHAN / Number_of_active_active_channels) - 1] <i>Note:</i> If this field is setup with a value outside the specified range data corruption and channel crosstalk may happen. If changing the default value of this register, limit the doorbelled channels to the range: [0 : Number_of_active_active_channels - 1]. The actual prefetch allocation space is the value of this field plus one. So, for example, setting it to zero means that it has allocated space for one descriptor. Value After Reset: {CC_HDMA_REG_WR_PF_DEPTH} Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CX_DMA_PF_ENABLE

3.67.6 DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF

- **Name:** DMA Write Engine Channel Arbitration Weight Low Register.
- **Description:** The 5-bit channel weight (for write channels 0-3) specifies the maximum number of TLP requests that the DMA can issue for that channel before it must return to the arbitration routine. When the channel weight count is reached or DMA channel request transfer size reaches zero, the WWR arbiter selects the next channel to be processed. Your software must initialize this register before ringing the doorbell. For more information, see "Multichannel Arbitration". Value range is (0-0x1F) corresponding to (1-32) transaction requests.

Bits	Name	Memory Access	Description
0	DMA_READ_ENGINE	* Varies	DMA Read Engine Enable. For normal operation, you must initially set this bit to '1', before any other software setup action. You do not need to toggle or rewrite to this bit during normal operation. You should set this field to '0' when you want to "Soft Reset" the DMA controller read logic. There are three possible reasons for resetting the DMA controller read logic: ■ The "Abort Interrupt Status" bit is set in the DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF), and any of the bits in the DMA Read Error Status Low Register (DMA_READ_ERR_STATUS_LOW_OFF) is set. Resetting the DMA controller read logic re-initializes the control logic, ensuring that the next DMA read transfer is executed successfully. ■ You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the channel Status field (CS) of the DMA Read Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_i) is set to "Stopped". Resetting the DMA controller read logic re-initializes the control logic ensuring that the next DMA read transfer is executed successfully. ■ During software development, when you incorrectly program the DMA read engine. To "Soft Reset" the DMA controller read logic, you must: ■ De-assert the DMA read engine enable bit. ■ Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA read engine enable bit returns a '0'.

Bits	Name	Memory Access	Description
0...(cont .)	DMA_READ_ENGINE.	* Varies	■ Assert the DMA read engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA read transfer does not start until you write to the DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x1 (ENABLE): Enable ■ 0x0 (DISABLE): Disable (Soft Reset) Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: untestable Volatile: true Memory Access:

Bits	Name	Memory Access	Description
31	RD_STOP	* Varies	Stop. Set in conjunction with the Doorbell Number field. The DMA read channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_RDCH_i) to ensure that the read channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

9:0	DMA_READ_ENGINE_MAX_PREFETCH	R/W	This field controls the linked list prefetch allocation space for each of the HDMA read engine channels. Each channel will be able to store as many linked list elements as specified here. Therefore this field must be within the following range: $[0 : \text{floor}(\text{CX_DMA_RD_LLQ} * \text{CC_NUM_DMA_RD_CHAN} / \text{Number_of_active_active_channels}) - 1]$. <i>Note:</i> If this field is setup with a value outside the specified range data corruption and channel crosstalk may happen. If changing the default value of this register, limit the doorbelled channels to the range: $[0 : \text{Number_of_active_active_channels} - 1]$. The actual prefetch allocation space is the value of this field plus one. So, for example, setting it to zero means that it has allocated space for one descriptor. Value After Reset: {CC_HDMA_REG_RD_PF_DEPTH} Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CX_DMA_PF_ENABLE

3.67.11 DMA_READ_CHANNEL_ARB_WEIGHT_LOW_OFF

- **Name:** DMA Read Engine Channel Arbitration Weight Low Register.
- **Description:** The 5-bit channel weight (for read channels 0-3) specifies the maximum number of TLP requests that the DMA can issue for that channel before it must return to the arbitration routine. When the channel weight count is reached or DMA channel request transfer size reaches zero, the WWR arbiter selects the next channel to be processed. Your software must initialize this register before ringing the doorbell. For more information, see "Multichannel Arbitration". Value range is (0-0x1F) corresponding to (1-32) transaction requests.

Bits	Name	Memory Access	Description
23:16	RD_ABORT_INT_STATUS	* Varies	Abort Interrupt Status. The DMA read channel has detected an error, or you manually stopped the transfer as described in "Stopping the DMA Transfer (Software Stop)". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. You can read the DMA Read Error Status Low Register (DMA_READ_ERR_STATUS_LOW_OFF) and DMA Read Error Status High Register (DMA_READ_ERR_STATUS_HIGH_OFF) to determine the source of the error. ■ Enabling: For more information, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
23:16	LINK_LIST_ELEMENT_FETCH_ERROR_DETECT	R	Linked List Element Fetch Error Detected. ■ The DMA read channel has received an error response from the AXI bus while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF). Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
7:0	APP_WR_ERR_DETECT	R	Application Write Error Detected. The DMA read channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while writing data to it. This error is fatal. You must restart the transfer from the beginning, as the channel context is corrupted, and the transfer is not rolled back. For more information, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For more information, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF). Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true

7:0	UNSUPPORTED_REQ

Table 3-625 Fields for Register: DMA_READ_ERR_STATUS_HIGH_OFF

Bits	Name	Memory Access	Description
31:24	DATA_POISONING	R	Data Poisoning. The DMA read channel has detected data poisoning in the completion from the remote device (in response to the MRd request). The DMA read channel will drop the completion and then be halted. The CX_FLT_MASK_UR_POIS filter rule does not affect this behavior. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For more information, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && CC_DMA_ENABLE && CC_UNROLL_ENABLE Testable: writeAsRead Volatile: true
23:16	CPL_TIMEOUT	R	Completion Time Out. The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received. For more information, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Bits	Name	Memory Access	Description
15:8	CPL_ABORT	R	Completer Abort. The DMA read channel has received a PCIe completer abort completion status from the remote device in response to the MRd request. For more information, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For more information, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. 7:0	UNSUPPORTED_REQ	R	Unsupported Request. The DMA read channel has received a PCIe unsupported request completion status from the remote device in response to the MRd request. For more information, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For more information, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. 26	DMA_RESERVED5	* Varies	Reserved. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "
25	DMA_RO	* Varies	Relaxed Ordering TLP Header Bit (RO). DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
24	DMA_NS_SRC	* Varies	Source No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "
23	DMA_NS_DST	* Varies	Destination No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
22	DMA_MEM_TYPE	* Varies	Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: For more information, see "ACE-Lite Features and Limitations" section of the <i>Databook</i>. Irrespective of the value of this field, Linked list descriptor requests have this attribute set to 0x1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (PERIPHERAL): peripheral type ■ 0x1 (MEM_TYPE): memory type Value After Reset: 0x0 Exists: CC_DMA_ENABLE && AXI_POPULATED && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
21:17	DMA_ELEMENT_PREFETCH	* Varies	This field controls how many elements the HDMA Write Channel should prefetch and its updated by the linked list element pointer loaded by HDMA. The valid value range is [0 : DMA_WRITE_ENGINE_PF_OFF.DMA_WRITE_ENGINE_MAX_PREFETCH]. <i>Note:</i> The actual prefetch amount is the value of this register plus one. For example, if set with 0, the prefetch is 1. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CX_DMA_PF_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
16:12	DMA_FUNC_NUM	* Varies	DMA Channel Physical Function Number. This field indicates the physical function associated with the DMA channel. The controller uses this field to form the requester ID of the generated MRd/MWr DMA TLPs. <i>Note:</i> ■ When SR-IOV is enabled, you must consider DMA_VF and DMA_VF_EN fields of DMA_CH_CONTROL2_OFF_* as well to determine the requester ID for the requests. ■ The behavior is undefined if any value outside of the valid range is set for this field. ■ The DMA drives the value of this field in the XADM/RADM signals d_client[0]1_tlp_func_num/d_radm_trgt1_func_num. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (Min_Val): Physical Channel Function Number starts at 0. ■ 0x1f (Max_Val): The maximum number of Physical Functions is given by CX_NFUNC, so the maximum value of this field is CX_NFUNC-1. Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
11:10	DMA_RESERVED1	* Varies	Reserved. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "
9	LLE	* Varies	Linked List Enable (LLE). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x1 (ENABLE): Enable linked list operation ■ 0x0 (DISABLE): Disable linked list operation Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
8	CCS	* Varies	Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more information, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""
7	DMA_RESERVED0	* Varies	Reserved. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
6:5	CS	R/W	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is as follows: Values: ■ 0x0 (RESERVED): Reserved ■ 0x1 (RUNNING): This channel is active and transferring data ■ 0x2 (HALTED): An error condition has been detected, and the DMA has stopped this channel ■ 0x3 (STOPPED): The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF) Value After Reset: {(CX_DMA_PF_ENABLE==0) ? 0 : 3} Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true

Bits	Name	Memory Access	Description
4	RIE	* Varies	Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more information, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a <i>link</i> LL element. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
3	LIE	* Varies	Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more information, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a <i>link</i> LL element. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
2	LLP	* Varies	Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && !CX_DMA_PF_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Bits	Name	Memory Access	Description
1	TCB	* Varies	Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more information, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\": (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\": \"read-write\" "

Bits	Name	Memory Access	Description
0	CB	* Varies	Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more information, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

3.67.49 DMA_CH_CONTROL2_OFF_WRCH_i (for i = 0; i <= CC_NUM_DMA_WR_CHAN-1)

- **Name:** DMA Write Channel Control 2 Register.
- **Description:** This register controls the DMA write channel operation. This register provides control features in addition to DMA Write Channel Control 1 Register.

- **Name:** DMA Write Transfer Size Register.
- **Description:** This register holds the DMA write transfer size.
- **Size:** 32 bits
- **Offset:** B+i*2*0x100+0x208
- **Exists:** (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 || CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0)

Table 3-645 Fields for Register: DMA_TRANSFER_SIZE_OFF_WRCH_i (for i = 0; i <= CC_NUM_DMA_WR_CHAN-1)

Bits	Name	Memory Access	Description
31:0	DMA_TRANSFER_SIZE	* Varies	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Table 3-650 Fields for Register: DMA_LL_P_LOW_OFF_WRCH_i (for i = 0; i <= CC_NUM_DMA_WR_CHAN-1)

Bits	Name	Memory Access	Description
31:0	LLP_LOW	* Varies	Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. When using legacy DMA to point to the next element in the transfer list after the previous element is consumed. ■ When the current element is a data element; this field is incremented by 6 DWORDs. ■ When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. When using HDMA with CC_LEGACY_DMA_MAP =1, it fetches descriptors from local memory respecting the following patterns: ■ When the current element is a data element; HDMA increments this field by 6 DWORDs times the prefetch depth. For more information, see registers HDMA_ELEM_P_F_OFF_WRCH* and HDMA_QOS_OFF_WRCH* ■ When the current element is a link element; HDMA overwrites this field with the LL Element Pointer of the next LL element structure. The current fetched memory address pointer is not directly visible in this register, instead HDMA updates this register on the following occurrences: ■ Watermark interrupt event ■ Channel Status ABORT event ■ Channel Status STOP event On a watermark interrupt event this register points to the descriptor's address that triggered it. A channel status STOP or ABORT events are end of transfer events that makes this register point to the next data to transfer after the event. <i>Note:</i> The access attributes of this field are as follows:

6:5	CS	R/W	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is as follows: Values: ■ 0x0 (RSVD): Reserved ■ 0x1 (RUN): Running. This channel is active and transferring data. ■ 0x2 (HALT): Halted. An error condition has been detected, and the DMA has stopped this channel. ■ 0x3 (STOP): Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Read Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF). Value After Reset: {(CX_DMA_PF_ENABLE==0) ? 0 : 3} Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_RD_CHAN>0) Testable: writeAsRead Volatile: true

Table 3-654 Fields for Register: DMA_TRANSFER_SIZE_OFF_RDCH_i (for i = 0; i <= CC_NUM_DMA_RD_CHAN-1)

Bits	Name	Memory Access	Description
31:0	DMA_TRANSFER_SIZE	* Varies	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: 0x0 Exists: CC_DMA_ENABLE && CC_UNROLL_ENABLE && (CC_DMA_ENABLE && CC_UNROLL_ENABLE && CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_RD_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Table 3-659 Fields for Register: DMA_LL_P_LOW_OFF_RDCH_i (for i = 0; i <= CC_NUM_DMA_RD_CHAN-1)

Bits	Name	Memory Access	Description
31:0	LLP_LOW	* Varies	Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Used in linked list mode only. When using legacy DMA to point to the next element in the transfer list after the previous element is consumed. ■ When the current element is a data element; this field is incremented by 6 DWORDs. ■ When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. When using HDMA with CC_LEGACY_DMA_MAP =1, it fetches descriptors from local memory respecting the following patterns: ■ When the current element is a data element; HDMA increments this field by 6 DWORDs times the prefetch depth. For more information, see registers HDMA_ELEM_P_F_OFF_RDCH* and HDMA_QOS_OFF_RDCH*. ■ When the current element is a link element; HDMA overwrites this field with the LL Element Pointer of the next LL element structure. The current fetched memory address pointer is not directly visible in this register, instead HDMA updates this register on the following occurrences: ■ Watermark interrupt event ■ Channel Status ABORT event ■ Channel Status STOP event On a watermark interrupt event this register points to the descriptor's address that triggered it. A channel status STOP or ABORT events are end of transfer events that makes this register point to the next data to transfer after the event. <i>Note</i>

Table 3-668 Fields for Register: HDMA_XFERSIZE_OFF_WRCH_i (for i = 0; i <= CC_NUM_DMA_WR_CHAN-1)

Bits	Name	Memory Access	Description
31:0	XFERSIZE	* Varies	HDMA Write Channel Transfer Size. You program this register with the size of the HDMA transfer. The maximum HDMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). HDMA automatically decrements the value of this field as the write channel transfer progresses. This field indicates the number of bytes remaining to be requested. When all bytes are requested the current transfer size is zero. In LL mode, the HDMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, but it is not reliable for that specific usage, as it is updated after read requests and not after write requests. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (Min_Val): Min Val ■ 0xffffffff (Max_Val): Max Val Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && !CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Bits	Name	Memory Access	Description
25:16	PF_DEPTH	* Varies	This field controls the linked list prefetch allocation space for an HDMA write channel. Each write channel stores PF_DEPTH plus '1' linked list elements. For example, if PF_DEPTH =0, the write channel stores one linked list element. This field must be within the range: [0 : floor(CX_DMA_WR_LLQ * CC_NUM_DMA_WR_CHAN / number_of_active_channels) - 1]. <i>Note:</i> If this field is set to a value outside the specified range, data corruption or channel crosstalk may happen. If PF_DEPTH is changed at run time, only channels in the range: [0 : number_of_active_channels - 1] can be doorbelled. This field cannot be changed while any write engine channel is in doorbell state. Doing so might yield undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Value After Reset: CC_HDMA_REG_WR_PF_DEPTH Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && !CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_WR_CHAN>0) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\" "

Table 3-695 Fields for Register: HDMA_XFERSIZE_OFF_RDCH_i (for i = 0; i <= CC_NUM_DMA_RD_CHAN-1)

Bits	Name	Memory Access	Description
31:0	XFERSIZE	* Varies	HDMA Read Channel Transfer Size. You program this register with the size of the HDMA transfer. The maximum HDMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). HDMA automatically decrements the value of this field as the read channel transfer progresses. This field indicates the number of bytes remaining to be requested. When all bytes are requested the current transfer size is zero. In LL mode, the HDMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, but it is not reliable for that specific usage, as it is updated after read requests and not after write requests. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (Min_Val): Min Val ■ 0xffffffff (Max_Val): Max Val Value After Reset: 0x0 Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && !CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_RD_CHAN>0) Testable: writeAsRead Volatile: true Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

25:16	PF_DEPTH	* Varies	This field controls the linked list prefetch allocation space for an HDMA read channel. Each read channel stores PF_DEPTH plus '1' linked list elements. For example, if PF_DEPTH =0, the read channel stores one linked list element. This field must be within the range: [0 : floor(CX_DMA_RD_LLQ * CC_NUM_DMA_RD_CHAN / number_of_active_channels) - 1]. <i>Note:</i> ■ If this field is set to a value outside the specified range, data corruption or channel crosstalk may happen. ■ If PF_DEPTH is changed at run time, only channels in the range: [0 : number_of_active_channels - 1] can be doorbelled. ■ This field cannot be changed while any read engine channel is in doorbell state. Doing so might yield undefined results. <i>Note:</i> The access attributes of this field are as follows: ■ Wire: R/W ■ Dbi: R/W Values: ■ 0x0 (Min_Field_value): Zero value ■ 0x3ff (Max_Field_value): Max value Value After Reset: CC_HDMA_REG_RD_PF_DEPTH Exists: (CC_DMA_ENABLE && CC_UNROLL_ENABLE && !CC_LEGACY_DMA_MAP && (CX_MEMORY_MAP_PCIE_TYPE==0 CX_MEMORY_MAP_PCIE_TYPE==1)) && (CC_NUM_DMA_RD_CHAN>0) Memory Access: "(CX_MEMORY_MAP_VIEW==0) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && !SNPS_RSVDPARAM_38) ? \"read-write\" : (CX_MEMORY_MAP_VIEW==1 && SNPS_RSVDPARAM_38) ? \"read-only\" : \"read-write\""

Internal Parameter Descriptions

Provides a description of the internal parameters that might be indirectly referenced in expressions in the Signals, Parameters, or Registers chapters. These parameters are not visible in the coreConsultant GUI and most of them are derived automatically from visible parameters. **You must not set any of these parameters directly.**

Some expressions might refer to TCL functions or procedures (sometimes identified as **function_of**) that coreConsultant uses to make calculations. The exact formula used by these TCL functions is not provided in this chapter. However, when you configure the core in coreConsultant, all TCL functions and parameters are evaluated completely; and the resulting values are displayed where appropriate in the coreConsultant GUI reports.
